1. Scope

(Informative)

A number of Device Management specifications have been defined within OMA. See [DMBOOT], [DMDDFDTD], [DMNOTI], [DMPRO], [DMREPU], [DMRD], [DMSEC], [DMSTDOBJ], [DMTND], and [DMTNDS]. These specifications, in its entirety referred to as OMA DM v1.2 specifications in [ERELDDM], define protocol and mechanism to be used between a Device Management Server and a mobile device, data model made available for remote manipulation of a mobile device, security and policy to control the access to a particular resource in the mobile device.

This document defines the requirements for Device Management Scheduling functionality, which is based on OMA DM v1.2 specifications and makes use of the functionalities provided by OMA DM v1.2 specifications to define special capabilities of processing management actions and/or other types of actions in given times and conditions according to the schedule set by the management systems in advance.
2. References

2.1 Normative References

2.2 Informative References

3. Terminology and Conventions

3.1 Conventions

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

All sections and appendixes, except “Scope” and “Introduction”, are normative, unless they are explicitly indicated to be informative.
3.2 Definitions

**Device**
In this context, a Device is a voice and/or data terminal that uses a Wireless Bearer for data transfer. Device types may include (but are not limited to): mobile phones (GSM, CDMA, 3GSM, etc.), data-only terminals, PDAs, laptop computers, PCMCIA cards for data communication, unattended data-only Devices (e.g., vending machines), and smart cards if associated with these Devices. If within a particular context an associated smart card should not be regarded as part of a Device this is marked explicitly.

**Device Management**
Management of the Device configuration and other managed objects of Devices from the point of view of the various Management Authorities. Device Management includes:
- Setting initial configuration information in Devices
- Subsequent updates of persistent information in Devices
- Retrieval of management information from Devices
- Processing events and alarms generated by Devices

**Device Management Server (or DM Server)**
The Device Management Server is an entity that is responsible for maintaining one or more Devices, in whole or in part. Its role is to facilitate the easy maintenance of a Device.

**Device Management System**
A background system capable to interact with a (set of) Device(s) for the purpose of Device Management.

**Local Wired Bearer**
Serial, USB, Ethernet

**Management Authority**
An entity that has the right to perform a specific Device Management function on a Device or manipulate a given data element or parameter. For example, the Network Operator, handset manufacturer, enterprise, or Device owner may be the authority or share authority for managing the Device. One Management Authority may own all Device resources or may share or delegate all or parts of these with/to other Management Authorities.

**Management Object**
A logical element that can contain or represent and manage configurable data and software within a Device. The data and/or software includes but is not limited to
- Parameters such as connectivity address, User preferences, proxy settings, User Identity, etc.
- Software such as applications, applets, drivers, modules, firmware and their updates.

A management object may represent the complete device configuration or a portion of a device configuration. There may be multiple Management Objects on a Device with a pre-specified relationship between them. Each Management Object will support the following operations.
- Add/Install – insert new elements into a Management Object.
- Replace/Update – modify existing and/or insert new elements into a Management Object.
- Delete/Uninstall – remove existing elements from a Management Object.
- Query/Enumerate – List all or part of a Management Object.

**Network Bearers**
Wireless Bearer and Local Wired Bearers

**Network Operator**
An entity that is licensed and allocated frequency to operate a public mobile wireless telecommunications network for the purpose of providing publicly available commercial services.

**On-Device Tool**
An application or process that runs on the Device either embedded or installed.

**Parameters**
In this context, parameters are service-related data elements that are stored in the Device and can be manipulated (i.e., changed, added, or deleted) over Network Bearers. For example, system parameters can be used to establish or maintain a bearer session, and application parameters can be used to specify the profile of a particular service, or some parameters may be related with performance characteristics.

**Policy**
The set of Service configuration settings and installed applications which are mandated by the Management Authority.

**Radio Software**
The software within a Device that is coupled with the radio hardware to derive the overall “radio” functionality. Radio software is not to be confused with User applications and content, but has certain commonality for functional requirements for device management.

**Schedule**
A plan for performing management operations, including the trigger for the operation.
Service Provider | An entity that provides and administers a service to a Subscriber and/or User. The Network Operator is often a Service Provider.
Subscriber | The individual or organisation that is paying for service.
Trap | The event that is generated by various sources in the Device which the Device Management System would be interested to know. The Trap source includes for example Radio Software, other OMA Enablers, or device drivers.
User | The individual who is in possession of and operates the Device.
Wireless Bearer | WAN Network Bearers (e.g. GPRS, GSM Data, CDMA), WLAN Bearers (802.1x), Local Wireless Network Bearers (e.g. Bluetooth, IR)

3.3 Abbreviations

CDMA | Code Division Multiple Access
DM | Device Management
DMS | Device Management Server
GPRS | General Packet Radio Service
GSM | Global System for Mobile Communication
IR | InfraRed
MMS | Multimedia Messaging Service
MO | Management Object
OMA | Open Mobile Alliance
OTA | Over The Air
PCMCIA | Personal Computer Memory Card International Association
PDA | Personal Digital Assistant
POST | Power On Self Test
UI | User Interface
USB | Universal Serial Bus
QoS | Quality of Service
WAN | Wide Area Network
WAP | Wireless Application Protocol
WLAN | Wireless Local Access Network
4. Introduction (Informative)

Continually expanding mobile application service gives rise to the growth in the number of Devices with different types and functionalities. Such a growth has made it more difficult and expensive to manage the Device and provide satisfactory customer support. Device administration systems need to be more flexible and cost-effective to address the issue.

Device Management Scheduling aims to further reduce network operation cost by offline processing of the scheduled management commands, and enhance user experience by allowing for example earlier response time to the local events of the device. Device Management Scheduling specifications will provide special capabilities of processing management actions and/or other types of actions in given times and conditions according to the schedule set by the management systems in advance.

The actors involved in Device Management Scheduling include Management Authorities (e.g. Network Operators, Enterprise Managers, Service Providers), Device Management Systems, Subscribers and Users.

The objective of this document is to develop a standardized approach to Device Management Scheduling and its requirements.
5. Use Cases

5.1 Common Scheduling Functionality

More and more On-device Tools such as Device Health Diagnostic Tools, Scan Engines, Loggers, and Monitors are becoming in use in mobile environments. One of the integral features of those tools is the ability to schedule their invocations. It is highly desirable to define one common scheduling framework and provide it for those tools.

5.1.1 Short Description

The DM Server creates schedules to control the invocation of an On-Device Tool. The schedule consists of the information such as when to start and stop the tool, which arguments to be used for each invocation, etc. After installation of the schedules, the tool is invoked automatically (e.g. regular basis, after erroneous operation, bootstrap).

5.1.2 Actors

- User
- Device
- Device Management Server
- Management Authority

5.1.2.1 Actor Specific Issues

- User: Different and inconsistent user experience should be avoided.
- Device: Having various tools on the device with different implementation of their own but the similar scheduling functionalities is not desirable with regards to the efficient use of limited resources of the device and the efforts for implementation.
- Management Authority: The burden of managing the scheduling functionalities of various tools on large number of devices is high.

5.1.2.2 Actor Specific Benefits

- User: The User will be provided with consistent user experience when using scheduling functionalities of the various tools on the device.
- Device: By having common scheduling functionality reusable by various tools on the device, the burden on the resources and implementation efforts will be reduced.
- Management Authority: The burden of managing the scheduling functionalities of various tools on large number of devices will be reduced because one common logic can be applied for all of them.

5.1.3 Pre-conditions

The Device has been provisioned and is capable of interacting with the DM server. The DM Server has sufficient access right to run the schedules in the Device. Device has sufficient resource (e.g. processing power, memory) to run the schedules requested by the DM Server.

5.1.4 Post-conditions

The schedules are installed in the Device and On-Device Tools are being invoked according to the schedule.
5.1.5 Normal Flow

1. DM Server creates schedules to control the invocation of an On-Device Tool.
2. Device asks for User Confirmation and the User agrees to install and activate the schedules.
3. The schedules are sent to the Device and verified as much as practical.
4. Device installs the schedules and sends confirmation to the DM Server to indicate that the schedules are accepted and installed.
5. At the specified time, the Device invokes the On-Device Tool.

5.1.6 Alternative Flow 1

- The schedules may be installed silently by skipping step 2 in Normal Flow.

5.1.7 Alternative Flow 2

- The User may modify or cancel the schedules setup by the DM server.

5.1.8 Alternative Flow 3

- At the specified event, the Device invokes the On-Device Tool.

5.2 Deferred Management Tasks

5.2.1 Short Description

Nicole notices a message box popped up on the display of her phone when she is engaged in an important conversation with her customer using the phone. The message asks her if she would like to upgrade her phone’s software. It also contains a short description about the upgrade offer such as the software version, how long it will take, the deadline of the upgrade, and the warning that the phone will reboot automatically during upgrade. After checking the message, she decides to defer it to next available time because she doesn’t want to let it disrupt the conversation. Two days later, the same message box appears on her handset. This time, she wants to accept the offer. When she accepts it, her phone is upgraded and result is reported back to the server. The whole process has been scheduled by the server in advance and executed locally by the Nicole’s phone.

5.2.2 Actors

- User
- Device
- Device Management Server

5.2.2.1 Actor Specific Issues

- User: Since some management tasks such as firmware upgrade or large object download may cause severe inconvenience to the User, there needs to be the way for the User to defer such management tasks as many times as she/he wants. Alternatively, the User may want to proactively initiate the pending or deferred management task rather than wait for the offer to be given repeatedly.
• **Device Management Server:** Device Management Server is going to allow the User to defer the offered management task, but it wants to do it cost-efficiently, therefore it doesn’t want to setup sessions every time it presents the offer to the User. The Device Management Server also wants to make sure that the management task will be performed before at certain point in time, the deadline.

### 5.2.2.2 Actor Specific Benefits

- **User:** The User is given the opportunity to defer and/or choose the best time for the offered management task.
- **Device Management Server:** Device Management Server can provide enhanced customer support cost-efficiently by scheduling the task at once.

### 5.2.3 Pre-conditions

There has been a session in advance. The server has scheduled a management task into the Device during the session.

### 5.2.4 Post-conditions

The management task is processed at the time of the User’s best convenience. The Device Management Server receives the result of the management task after it is processed.

### 5.2.5 Normal Flow

1. The schedule is encountered.
2. The Device prompts the User with offered management task.
3. The User decides if she/he will accept the offer. The process repeats steps 1-3 until the User accepts the offer.
4. The Device performs the offered management task.
5. The Device reports the result back to the Device Management Server.

### 5.2.6 Alternative Flow

#### 5.2.6.1 Alternative Flow 1

The User repeatedly defers the offered management task that the Management Authority needs to enforce before at a certain point in time, the deadline. Finally, it reaches the deadline and the User is forced to accept the offered management tasks. The Device reports the result back to the Device Management Server after completion of the management task.

#### 5.2.6.2 Alternative Flow 2

When a management task is scheduled, it becomes a pending management task that the User can proactively bring up and initiate whenever the User wants. The Device may provide a UI facility to notice the User about the pending management tasks, for example, a beep or an activated icon in the task bar shown in the corner of the display. By clicking upon the icon the User can browse the list of the pending tasks, among which the User selects one to initiate, or the User may configure one so that it will generate a pop-up message along with an alert signal some time later.
5.2.6.3 Alternative Flow 3

When Nicole is asked if she wants to upgrade her phone's software, she may defer the offer and configure the notification process herself for such parameters as the interval between the notifications and the type of notifications. Nicole is allowed to do so when the software upgrade was first scheduled.

5.2.6.4 Alternative Flow 4

When Nicole is asked if she wants to defer a management task at her phone she may defer the offer and configure the exact time to perform this operation. Nicole can therefore allow the Device and server to defer a management task at a designated time, such as 3:00 AM, without user's interaction.

5.2.6.5 Alternative Flow 5

When Nicole goes abroad with her mobile device. Her device receives a request to perform a management task that involves additional transfer costs while roaming. But, depending on the Device Management Server's policy settings the request is either deferred to the time when Nicole comes back to her home Network (silently stored in her device) or Nicole is asked explicitly whether she wants the immediate task execution irrespective of costs.

[TBD reword this flow]

5.3 Scheduled Data Collection

5.3.1 Short Description

A Management Authority received a lot of customer complains regarding bad voice quality, rejected phone calls and low data rate. The Management Authority decided to collect monitoring data from a user's perspective in order to analyze the Quality of Service (QoS) problem. The Management Authority would like to insert a data collection profile in the device to collect several vital indicators for QoS. The selected devices belonged to those who have called and complained about the quality of service and some randomly selected subscribers.

The device prompts to James a text message requesting his permission to enable data collection capability on his cell phone., due to a QoS monitoring activity. He examines the collection items and accepted the profile.

5.3.2 Actors

- User
- Device
- Device Management Server
- Management Authority

5.3.2.1 Actor Specific Issues

- **User:** The User wants the Network Operator to solve the problems of his device. However, not all subscribers welcome operators collecting data from their mobile devices. Besides privacy concerns, data collection activities consumes CPU power, battery and network bandwidth. On the other hand, some subscribers may welcome proactive monitoring to ensure quality of service. Some subscribers may be willing to exchange for tariff discount by subjecting their mobile devices as data collection samples. Subscriber’s consent is required before setting up monitoring schedules. And the consent also depends on what is collected, what is the effect on the mobile device with collection activities.

- **Device Management Server:** Two variables in the data collection activity. One is the time variable, which includes the time of occurrence and the repetitiveness in time. The other one is the managed objects to be monitored and
collected. It would off-load a Device Management Server’s work if a mobile device can remember these two variables and deliver reports without Device Management Server’s intervention. Not all mobile devices have all the memory, battery capacity and computing power to continuously maintain these chronic jobs on behalf of a Device Management Server. It is possible that a Device Management Server needs to remember collection profiles on a device basis.

- **Management Authority**: The Management Authority is interested in improving the QoS of the services offered to the subscribers.

### 5.3.2.2 Actor Specific Benefits

- **User**: The User can use his phone since the QoS problems are solved. (The User is given the choice to participate in exchange of consistent quality of service or tariff discount).

- **Device Management Server**: Device Management Server can provide enhanced customer support cost-efficiently by getting valuable performance data from user’s point of view.

- **Management Authority**: The Management Authority is able to collect data from the subscriber’s devices to improve the QoS.

### 5.3.3 Pre-conditions

The device is capable of receiving and executing a Schedule.

### 5.3.4 Post-conditions

The management task is processed at the time of the User’s best convenience. The Device Management Server receives the result of the management task after it is processed.

### 5.3.5 Normal Flow

1. The Device Management Server requests to the Device the permission to run the schedule for running data collection profile on the Device
2. The Device prompts the User to ask authorisation for inserting and running the data collection profile on the Device.
3. The User accepts the offer.
4. The Schedule is setup on the device.
5. The Device performs the data collection task
6. The Device reports the result back to the Device Management Server from time to time.

### 5.3.6 Alternative Flow

#### 5.3.6.1 Alternative Flow 1

The User accepted offer of data collection profile and the data collection activity has been in action for a while. The User changes his mind and wants to terminate it. The User disables it and subsequently the Device Management Server is informed about this and removes the schedule from the Device.
5.4 Scheduling When Switched Off

5.4.1 Short Description

Isabel has a scheduled software upgrade (to be done late at night). She is very tired, though, and turns her device off before the upgrade can occur. When she switches on her device in the morning, the device determines it was unable to execute the scheduled task. Depending on what the server has indicated, the device may do any number of things (e.g. cancel the upgrade, report to the server, automatically execute the upgrade).

5.4.2 Actors

- User
- Device
- Management Authority

5.4.2.1 Actor Specific Issues

- **User:** The User would like to be able to not be disturbed with management actions.
- **Management Authority:** The Management Authority is interested in making sure some management actions can be done are done within a period of time and with as less disturbance to the user as possible.

5.4.2.2 Actor Specific Benefits

- **User:** The User is provided with the ability to safely shut off their device, and possibly have the scheduled activities automatically take place.
- **Management Authority:** The Management Authority is able to have their scheduled tasks executed, regardless of whether the device gets switched off or not.

5.4.3 Pre-conditions

The device is capable of receiving and executing a Schedule.

5.4.4 Post-conditions

n/a.

5.4.5 Normal Flow

1. The DM server installs a schedule with reporting enabled or disabled.
2. The device is switched off.
3. During the period of time the device is switched off, a schedule was intended to be executed.
4. The device is switched on.
5. The device detects that a schedule was missed.
6. The device reports the missed schedule to the DM server if the reporting is enabled.
5.4.6 Alternate Flow

- The server installs a schedule, with indication to automatically execute a missed schedule.
- The device is switched off.
- While the device is switched off, a schedule that was intended to be executed was missed.
- The device is switched on.
- The device detects that a schedule was missed.
- As soon as practical, the device executes the missed schedule.

5.5 Reconfiguration of Parameters

5.5.1 Short Description

The DM Server creates schedules that include a group of parameters among which some are preferred in one situation and others in another situation. After installation of the schedules, the preferred parameters are selected and used.

5.5.2 Actors

- User
- Device
- Device Management Server

5.5.2.1 Actor Specific Issues

- User: The User wants to be able to have as much quality of service in the device as possible.
- Device Management Server: The Device Management Server wants to be able to send the device a Schedule so that in certain conditions, some parameters of the device can be modified.

5.5.2.2 Actor Specific Benefits

- User: The parameters of the device can be modified without user intervention on some specific conditions.
- Management Authority: The Device Management Server can make sure some parameters of the device can be modified on certain conditions without having to access the device each time he wants to change the parameters.

5.5.3 Pre-conditions

- The Device has been provisioned and is capable of interacting with the DM server.
- The DM Server has sufficient access right to run the schedules in the Device.
- Device has sufficient resource (e.g. processing power, memory) to run the schedules requested by the DM Server.
- The DM Schedule has been already been installed on the device.
5.5.4 Post-conditions

- The schedules are installed in the Device and, over time, different sets of the parameters are selected and used among the group of parameters that are included in the schedules.
- The device’s parameters can be modified based on the scenarios and circumstances.

5.5.5 Normal Flow

1. The schedule is triggered.
2. Device selects and uses some of the parameters among the group of parameters that are included in the schedules.
3. Optionally, the device may inform the server about the reconfigured parameters.

5.5.6 Alternative Flow

5.5.6.1 Alternative Flow 1

- Device may ask for User Confirmation before parameters reselection.
- Device may send status report to the DM Server after parameters reselection.

<tr>
<td>DM-SCHED-DEVICE-05</td>
<td>The Device SHOULD execute the scheduled management operations.</td>
<td>DM Scheduling 1.0</td>
</tr>
<tr>
<td>DM-SCHED-DEVICE-06</td>
<td>The Device MAY provide the user interface so that the User may alter, suspend, resume, terminate, and get information of the Schedules on the Device (only for the special Schedules where the DM Server grants such a control to the User).</td>
<td>Deleted</td>
</tr>
<tr>
<td>DM-SCHED-DEVICE-07</td>
<td>The Device MAY provide the user interface to inform and get input from the User before the installation, reconfiguration, and termination of the Schedules on the Device, where the DM Server grants such a control to the User.</td>
<td>Deleted</td>
</tr>
</tbody>
</table>
The Device MAY provide the user interface to inform and get input from the User before the execution of the scheduled tasks, in case the DM Server allows this.

The Device SHALL proactively report the status changes of the Schedules to the DM server if it is requested by the DM server which created them, in case the DM Server provides this schedule with the capability to do so.

The Device SHALL proactively report the progress of the scheduled management tasks to the DM server if it is requested by the DM server that created them.

The Device MAY be able to detect the missed time-based Schedules and retroactively perform all the missed schedules as indicated by DM Server (execute them, delay them or discard them informing the Server).

If allowed to do so by the DM Server, the Device MAY be aware of the Schedules that are intended to be executed when the user attempts to switch off the Device and MAY inform the User of the possibility to execute them before the Device is switched off.

The Device SHALL store Schedules as Management Objects

The Device SHALL be able to provide information on the list of the Schedule on the Device to the DM Server with sufficient access rights.

The Device SHALL be able to give information about the support for the DM Scheduling functionality.

The Device SHALL be able to receive and process the Scheduling Request from the DM server.

The Device SHALL send response to the Scheduling Request from the DM server indicating the success or failure.

The Device SHALL be capable of reporting back to the DM Server the status changes of the Schedule on the Device, in case this was allowed by the DM Server.

The Device SHOULD be able to report to DM Server errors related to Schedule operations.
