1. Scope

This document specifies the XML syntax and semantics used by OMA DS protocols. The DS Syntax protocol is defined by a set of messages that are conveyed between entities participating in a data synchronization operation. The DS Syntax protocol embodies the concept of a SyncML Package. The SyncML Package performs some set of operations. This conceptual “package” permits either a “batch” of multiple operations put together in a single SyncML Message or conveyed as separate SyncML Messages, each containing a single operation.

Please refer to [DSCONCEPTS] for further information on the OMA DS organization and history.

2.2 Informative References

None.
3. Terminology and Conventions

3.1 Conventions

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in RFC2119.

All sections and appendixes, except “Scope” and “Introduction”, are normative, unless they are explicitly indicated to be informative.

Any reference to elements of the Data Synchronization XML Schema is specified in this typeface. Any reference to attributes of the Data Synchronization XML Schema is specified in this typeface.

Schema fragments are shown as:

**Content Model:**

```
<x:s:attribute name="Atomic" type="xs:boolean" default="false"/>
```

Examples are shown as:

**Example n:** descriptive text

```
<Delete CmdID="401">
  ...
</Delete>
```

Most examples may be validated against the schema by incorporating them into the XML fragments of Appendix B. Also note that many of the examples manipulate objects relative to the hierarchy of objects shown in Appendix B.

3.2 Definitions

Please refer to the [DSCONCEPTS] document.

3.3 Abbreviations

Please refer to the [DSCONCEPTS] document.
4. Introduction

OMA Data Synchronization (OMA DS) is a specification for a common data synchronization framework and XML-based format, or representation protocol, for synchronizing data on networked devices. OMA Data Synchronization is designed for use between mobile devices that are intermittently connected to the network and network services that are continuously available on the network. OMA Data Synchronization can also be used for peer-to-peer data synchronization. OMA Data Synchronization is specifically designed to handle the case where the network services and the device store the data they are synchronizing in different formats or use different software systems.

This document specifies the XML syntax and semantics used by the OMA Data Synchronization Protocol.

The Data Synchronization Syntax is defined by a set of messages that are conveyed between entities participating in a data synchronization operation. The messages are represented as an XML document. XML is the industry standard for text document mark-up, as defined in [XML].

The Data Synchronization Syntax also can be identified as a MIME content type. MIME is the Internet standard for identifying multipurpose message contents. It provides a useful mechanism for differentiating between different content and document types.

The Data Synchronization Syntax supports protocol models that are based on a request/response command structure, as well as those that are based on a "blind push" command structure.

The Data Synchronization Syntax embodies the concept of a SyncML Package. The SyncML Package performs some set of operations. This conceptual "package" permits either a "batch" of multiple operations put together in a single SyncML Message or conveyed as separate SyncML Messages, each containing a single operation. SyncML Messages are the body of the MIME entities.

4.1 Version History

For a detailed change history of OMA-DS, refer to [DSHISTORY].

Specific Syntax changes include:

4.1.1 Version 1.0.1

CTCAP was moved from the Syntax Specification to Device Information [DSDEVINF], and FreeID and FreeMem were moved to the Meta Specification.

4.1.2 Version 1.1

MoreData and NumberOfChanges were added. The Specification set was split into Common, DS, and DM.

4.1.3 Version 1.2

Correlator, Field, Filter, FilterType, Move, Record, SourceParent, and TargetParent were added.

4.1.4 Version 2.0

The Meta Specification, including the elements and attributes of Anchor, FieldLevel, Format, FreeID, FreeMem, Last, MaxObjSize, Meta, Next, NextNonce, Size, and Type, were incorporated into the Syntax Specification. Support for Fingerprints was added, including FP, ID, and IDContainer. The explicit SyncAlert element, with its attributes of Behaviour, ChangeLogValidity, Direction, and IDValidity was created instead of using Alert. SourceClientURI, SourceClientParentURI, SourceServerURI, SourceServerParentURI, TargetClientURI, TargetClientParentURI, TargetServerURI, and TargetServerParentURI were created instead of using Source, SourceParent, Target, TargetParent and LocURI. VerDTD was renamed to Version. The flags and simple values of CmdID, Code, NoStatus, Atomic, AuthName, Cmd, CmdRef, Correlator, SftDel, FieldLevel, FilterType, MsgID, MsgRef, NextNonce, NumberOfChanges, Sequence, and Version were converted from elements to attributes.
5. SyncML

5.1 SyncML Package and Messages

In SyncML, the operations are conceptually bound into a SyncML Package. The SyncML Package is just a conceptual frame for one or more SyncML Messages that are REQUIRED to convey a set of protocol semantics.

A SyncML Message is a well-formed XML document and adheres to the Schema, but does not need to be validated. For example, a SyncML message does not need to be validated but the XML MUST adhere to whatever explicitly defined order appears in the Schema. The document is identified by the SyncML root or document element type. This element type acts as a parent container (i.e., root element type) for the SyncML Message.

The SyncML Message, as specified before, is an individual XML document. The document consists of a header, specified by the SyncHdr element type, and a body, specified by the SyncBody element type. The SyncML header specifies routing and versioning information about the SyncML Message. The SyncML body is a container for one or more SyncML Commands. The SyncML Commands are specified by individual element types. The SyncML Commands act as containers for other element types that describe the specifics of the SyncML command, including any data or meta-information.

5.2 SyncML Commands

SyncML defines the following "request" commands:

- **Add**. Allows the originator to ask that a data element or data elements supplied by the originator be added to data accessible to the recipient.
- **Alert**. Allows the originator to notify the recipient. The notification can be used as an application-to-application message or a message intended for display through the recipient's user interface.
- **Copy**. Allows the originator to ask that a data element or data elements accessible to the recipient be copied.
- **Delete**. Allows the originator to ask that a data element or data elements accessible to the recipient be deleted. A Delete command can include a request for the archiving of the data.
- **Get**. Allows the originator to ask for a data element or data elements from the recipient. A Get can include the resetting of any meta-information that the recipient maintains about the data element or collection.
- **Move**. Allows the originator to ask that a data element or data elements accessible to the recipient to be moved.
- **Put**. Allows the original to put a data element or data elements on to the recipient.
- **Replace**. Allows the originator to ask that a data element or data elements accessible to the recipient be replaced. This command makes a complete replacement of the data element.
- **Sync**. Allows the originator to specify that the included commands be treated as part of the synchronization of two data collections.
- **SyncAlert**. Allows the originator to negotiate the sync type with the recipient and also allows the originator to send fingerprints and data item identifiers to the recipient.

SyncML defines the following "response" commands:

- **Status**. Indicates the completion status of an operation or that an error occurred while processing a previous request, with an optional updated identifier.
- **Results**. Used to return the data results of a Get SyncML Command.

The SyncML Commands themselves do not fully define the semantics of the SyncML Operation. For example, “Adding” a document to an application to a database may have very different semantics from “Adding” a transaction request to a queue. The semantics of a SyncML Operation are determined by the type of data that is being operated upon. This means that it is possible for an originator to request an operation of a particular recipient that makes no sense to the recipient. In that case, the recipient MUST return an error response status code.
5.3 XML Usage

The SyncML Messages are represented in a mark-up language defined by [XML]. The DS Syntax protocol is an XML application. The DS Syntax Schema defines the XML Schema used to represent a DS Message. The DS Syntax Schema can be found in Section 7, but it is not necessary to read the Schema in order to understand the protocol.

SyncML makes use of XML name spaces. Name spaces MUST be declared on the first element type that uses an element type from the name space.

Names in XML are case sensitive. By convention in the DS Syntax, the element type and attribute list names are specified using the convention that the first character in each word of the name is in upper case text and remainder of the characters in each word of the names specified in lower case text. For example, SyncML for the Sync Mark-up Language tag or MsgRef for the Message Reference tag.

The element types in the DS Syntax Schema are defined within a namespace associated with the URI http://www.openmobilealliance.org/tech/profiles/OMA-DS-DS_2.0-Syntax-Schema-V2.0.xsd or the URN urn:oma:xml:ds:syntax:. The DS Syntax Schema are also identified by the ISO 9070 formal public identifier -//SYNCML//Schema SyncML 2.0//EN.

SyncML also makes use of XML standard attributes, such as xml:lang. Any XML standard attribute can be used in a SyncML document.

SyncML Messages are specified using well-formed XML. However, the SyncML Messages need not be valid XML. That is, the SyncML Messages do not need to specify the XML declaration, prolog, or schema locations. They only need to specify the body of the XML document. This restriction allows for the SyncML Messages to be specified with greater terseness than well-formed, valid XML documents.

The following examples should be considered equivalent:

**Fully Qualified:** This style is both well-formed and valid (provided a copy of the SyncML schema is available). This style is recommended for file formats, such as storing device information for later use.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<SyncML xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="OMA-SUP-XSD_DS_Syntax_Schema-V2.0.xsd"
  Version="2.0">
  ...
</SyncML>
```

**Minimally Qualified:** This style uniquely identifies the namespace as being OMA-DS SyncML, and is well-formed, but not valid. This style SHOULD be used when communicating over limited bandwidth.

```xml
<SyncML xmlns='syncml:syncml2.0' Version="2.0">
  ...
</SyncML>
```

**Unqualified:** This style MAY be used where the context is clear through other information.

```xml
<SyncML Version="2.0">
  ...
</SyncML>
```

**Namespace Qualified:** This style MAY be used where SyncML Information is included inside other XML documents, and the appropriate namespaces are declared. This style MUST be both well-formed and valid. The choice of namespaces (for elements, and attributes) is arbitrary. The use of any style like this SHOULD NOT be used for over-the-air communications.
One of the main advantages of XML is that it is a widely accepted International recommendation for text document mark-up. It provides for both human readability and machine process ability. In addition, XML allows the originator to capture the structure of a document, not just its content. This is extremely useful for applications such as data synchronization, where not just content, but structure semantics is often exchanged.

5.4 WBXML Usage

XML can be viewed as more verbose than alternative binary representations. This is often cited as a reason why it might not be appropriate for low bandwidth network protocols. In most cases, SyncML uses shortened element type and attribute names. This provides a minor reduction in verbosity. Additionally, the SyncML Messages can be encoded in a tokenized, binary format defined by [WBXML], or a standard content compression can be applied, such as HTTP’s “Content-Encoding: gzip”. The use of [WBXML] format or transport layer compression is external to specification of the SyncML protocol and transparent to any SyncML application. The combination of the use of shortened element type names and an alternative binary format makes SyncML competitive, from a compressed format perspective, with alternative, but private, binary representations.

For the purposes of OMA-DS, WBXML 1.1, WBXML 1.2 and WBXML 1.3 are functionally equivalent, and all MUST be accepted in implementations that support WBXML. Effectively, this merely requires the WBXML parser to accept 01, 02 or 03 as the first byte of the document.
6. Mark-up Language Description

The DS Syntax protocol is a document mark-up consisting of XML element and attribute types. This section provides a prose description of this mark-up. The types are defined in terms of their purpose or usage, parent elements, any restrictions on content or use and content model.

Restrictions listed in this document apply to Data Synchronization Protocol. Examples that illustrate the use of each element type can also be found in this document. Examples in this section make use of XML snippets. They are not intended to be complete XML documents, although most can be validated by incorporating them into the XML fragments of Appendix B. They are only provided to illustrate an example usage of the element type in question.

6.1 Static Conformance Requirements by Type

6.1.1 The Common Use Elements and Attributes

The following are common element types and attributes used by numerous other SyncML element types.

The following table further elucidates the static conformance requirements for the SyncML data description elements and attributes for devices conforming to this specification.

Table 5: Protocol Command Elements

* The Copy and Move commands MUST be supported by implementations that support hierarchical sync

### 6.1.6 Common Types for Elements

The following table further elucidates the common used types for the elements definition.

There are no static conformance requirements for these common types.
6.2 Element, Attribute, and Type Definitions

6.2.1 Add

Usage: Specifies the SyncML command to add data to a data collection.

Parent Elements: Sync, SyncBody

Content Model:

```xml
<xs:element name="Add" type="CommonOperationType"/>
```

Restrictions:

The Add command is generally used to convey to the recipient any additions made to the originator’s database. For example, a mobile device will indicate to the network server any additions made to the local calendar database.

The originator of the command SHOULD only send features/properties of the data item that are supported by the recipient. The device information document of the recipient can contain this information.

One or more Item element types MUST be specified. The Item element type specifies the data item added to the database. The SourceServerURI or SourceClientURI specified within the Item element type uniquely identifies the item, either relative to the corresponding TargetServerURI/TargetClientURI or SourceServerURI/SourceClientURI specified in the parent Sync command, relative to an absolute URI in the SourceServerParentURI, SourceClientParentURI, or TargetClientParentURI of a hierarchical object whose parent element is SyncBody, or by absolute URI with a non-hierarchical object when the parent element is SyncBody. Note that only certain combinations of these parameters are valid, as shown in Table 7: Add Source/Target Combinations, Table 8: Add Relative/Absolute URI Combinations, and the examples below.

When synchronizing hierarchical objects, the Item element for each object MUST include parent information. For this purpose SourceServerParentURI, SourceClientParentURI, or TargetClientParentURI MUST be used by the sending device referring to an existing parent. When synchronizing hierarchical objects when the parent element is SyncBody, these parent elements MUST be absolute URIs, and the SourceServerURI or SourceClientURI specified within the Item element type MUST be relative to the parent element. When the parent element is a Sync command all URIs MUST be relative URIs. Refer to Table 7: Add Source/Target Combinations, Table 8: Add Relative/Absolute URI Combinations, and the examples below for valid combinations.

The Item elements within an Add command MUST NOT attempt to specify a new identifier on the target, that is, specify either TargetServerURI or TargetClientURI.

When sending an Add command to a recipient that does not support Hierarchy, the Parent URI fields MUST NOT be sent, that is, any of SourceServerParentURI, SourceClientParentURI, TargetServerParentURI or TargetClientParentURI. When sending an Add command to a recipient that does not support Hierarchy when the parent element is SyncBody, the SourceServerURI or SourceClientURI specified within the Item element type MUST be absolute URIs. For all other cases, they MUST be relative URIs.

For examples of the use of absolute URIs, see the Copy command.

<table>

<tr>
<td>CommonOperationType</td>
<td>Add, Copy, Get, Move, Put</td>
</tr>
</tbody>
</table>

Table 6: Common Element Types
When the client is the recipient, it MAY assign new local identifiers (LUIDs) for the data items specified in this command. However, in such cases the client MUST also notify the server of the new LUID by returning the new LUID in the corresponding StatusItem element.

<table>
<thead>

</thead>
<tbody>
<tr>
<td>Parent Element</td>
<td>*Direct URIs</td>
<td>**Parent URIs</td>
</tr>
<tr>
<td>SyncBody</td>
<td>Absolute</td>
<td>N/A</td>
</tr>
<tr>
<td>Sync</td>
<td>Relative</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Table 8: Add Relative/Absolute URI Combinations

* Direct URIs refers to SourceServerURI or SourceClientURI.

** Parent URIs refers to SourceServerParentURI, SourceClientParentURI, or TargetClientParentURI.

Status Codes:

If the command completed successfully, then the (201) Item added exception condition is created by the command.

If the recipient determines that the data item already exists on the recipient’s database, then the (418) Already exists exception condition is created by the command.

If the originator’s authentication credentials specify a principal with insufficient rights to complete the command, then the (401) Unauthorized exception condition is created by the command. If no authentication credentials were specified, then (407) Authentication required exception condition is created by the command. A suitable challenge can also be returned.

Non-specific errors created by the recipient while attempting to complete the command create the (500) Command failed exception condition.
If there is insufficient space on the recipient database for the data item, then the (420) Device full exception condition is created by the command, and the originator SHOULD NOT attempt to add additional data until the recipient has more free space.

If the MIME content type or content format for the data item is not supported by the recipient, then the (415) Unsupported MIME content type or content format exception condition is created by the command.

**Example 1:** The client requests the server to add 2 new items of the same type, with credentials that provide write access to the current datastore. The Type information for all Items’ are provided by the Meta element under the Add command. The items are identified by the client LUID, which includes the fingerprint of the item.

```xml
<Add CmdID="101">
  <Cred>
    <Meta Type="syncml:auth-md5" Format="b64"/>
    <Data>Zz6EivR3yeaaENcRN6lpAQ==</Data>
  </Cred>
  <Meta Format="chr" Type="text/vcard"/>
  <Item>
    <SourceClientURI FP="0123">1001</SourceClientURI>
    <Data>BEGIN:VCARD
    VERSION:3.0
    ... END:VCARD
    </Data>
  </Item>
  <Item>
    <SourceClientURI FP="1234">1002</SourceClientURI>
    <Data>VERSION:3.0
    ...
    END:VCARD
    </Data>
  </Item>
</Add>
```

**Example 2:** The server requests the client to add a new item. The item is identified by the server’s GUID. The client may choose to assign a LUID to the item, in which case it would indicate that to the server in the corresponding StatusItem element, and the GUID would no longer be used.

```xml
<Add CmdID="102">
  <Item>
    <SourceServerURI>ABC012345_1003</SourceServerURI>
    <Meta Format="chr" Type="..."/>
    <Data>...
    </Data>
  </Item>
</Add>
```

**Example 3:** The client requests the server to add a new folder item to the root of the hierarchy.

```xml
<Add CmdID="103">
  <Item>
    <SourceClientURI FP="2345">1004</SourceClientURI>
    <SourceClientParentURI>./</SourceClientParentURI>
    <Meta Format="chr" Type="application/vnd.omads-folder+xml"/>
    <Data><![CDATA[
    <Folder>
    </Folder>]]>
  </Item>
</Add>
```
Example 4: The server requests the client to add a new folder item to an existing, mapped folder.

```xml
<Add CmdID="104">
  <Item>
    <SourceServerURI>ABC012345_1005</SourceServerURI>
    <TargetClientParentURI>1004</TargetClientParentURI>
    <Meta Format="chr" Type="application/vnd.omads-folder+xml"/>
    <Data><![CDATA[
      <Folder>
        <name>OMA</name>
        <created>20080401T123456</created>
        ...
      </Folder>]]>
    </Data>
  </Item>
</Add>
```

Example 5: The server requests the client to add a new item to a folder that is not yet mapped by the client (e.g. the folder was added during this session by the server)

```xml
<Add CmdID="105">
  <Meta Format="chr" Type="text/x-vcard"/>
  <Item>
    <SourceServerURI>ABC012345_1006</SourceServerURI>
    <SourceServerParentURI>ABC012345_1005</SourceServerParentURI>
    <Data>BEGIN:VCARD
    VERSION:3.0
    FN:Bruce Smith
    N:Smith;Bruce
    TEL;WORK;VOICE:+1-919-555-1234
    TEL;WORK;FAX:+1-919-555-9876
    EMAIL;INTERNET:bruce1@example.com
    END:VCARD
    </Data>
  </Item>
</Add>
```

Note: The above examples include all situations that need to be supported if hierarchy is supported. Examples 1 and 2 are the only examples that need to be supported if hierarchy is not supported. No other combinations of TargetServerURI/TargetClientURI, SourceServerURI/SourceClientURI, TargetServerParentURI/TargetClientParentURI or SourceServerParentURI/SourceClientParentURI should occur. For example, the client should never be in the situation of needing to add a data item to a folder that was added by the server, but is not yet mapped (use TargetServerParentURI), since the client could have already sent the new LUID in the corresponding StatusItem element when the folder was added before sending its Add command. Similarly, the server MUST NOT create LUIDs, and thus should never include a TargetClientURI in an Add command.
6.2.2 Alert

Usage: Specifies the specific event. The command provides a mechanism for communicating event information to the recipient, such as requesting for next message, last chunk of a large object not received, terminating a session, etc.

Parent Element: SyncBody

Content Model:

```xml
<xs:element name="Alert" type="AlertType"/>
<xs:complexType name="AlertType">
  <xs:sequence>
    <xs:element ref="Cred" minOccurs="0"/>
    <xs:element ref="Item" minOccurs="0" maxOccurs="unbounded"/>
  </xs:sequence>
  <xs:attribute ref="CmdID" use="required"/>
  <xs:attribute ref="Code" use="required"/>
  <xs:attribute ref="NoStatus" use="optional"/>
</xs:complexType>
```

Restrictions:

The `Code` attribute specifies the status code corresponding to a specific event for the recipient.

Optionally, one or more `Item` element types MAY be specified. The `Item` element type specifies parameters for the Alert command. The `TargetServerURI`/`TargetClientURI` and `SourceServerURI`/`SourceClientURI` specified within the `Item` element type MUST be an absolute URI.

If the command and the associated action are completed successfully, then the status code '200 OK' is created by the command.

If the command was accepted successfully, but the Alert action has not yet been executed successfully, then the (202) Accepted for processing exception condition is created by the command. A subsequent exception condition can be created to relate the eventual completion status of the associated Alert action.

Example: The following is an example for a data sync client to request for next message in the case of multiple messages in a package.

```xml
<Alert CmdID="1" Code="211">
  <Item>
    <TargetServerURI>./Contact/Contacts</TargetServerURI>
    <SourceClientURI>./C\System\Data\Contacts.cdb</SourceClientURI>
  </Item>
</Alert>
```

6.2.3 Anchor

Usage: Specifies the synchronization state information (i.e., sync anchor) for the current and previous synchronization session.

Parent Element: SyncAlert, Status

Content Model:

```xml
<xs:element name="Anchor"/>
<xs:complexType>
  <xs:attribute ref="Last" use="optional"/>
  <xs:attribute ref="Next" use="required"/>
</xs:complexType>
```
Restrictions:

The OPTIONAL Last attribute specifies the synchronization anchor for the previous synchronization session. The REQUIRED Next attribute specifies the synchronization anchor for the current synchronization session.

The value of Last and Next attributes MUST specify either an UTC based date/time stamp or a monotonically increasing numeric integer. If a date/time stamp, then the text MUST be in the complete representation, basic format defined by ISO8601.

All Last or Next values sent in a synchronization session by a particular sender MUST be of the same type, and MUST be used such that a comparison operation on values can determine older from newer.

Determination of the ordinal sequence of the version of an existing object in the recipient and the version of the object can be made by comparing the content information of the object with the value on the existing object.

Example:

```xml
<Anchor Last="2000-08-24T13:30:00Z" Next="2000-08-24T22:13:00Z"/>
```

Note that a comparison operator should find that the value of Next is greater than the value of Last (if present).

6.2.4 Atomic

Usage: Specifies that the subordinate commands be executed as a set or not at all.

Parent Element: Sync

Content Model:

```xml
<xs:attribute name="Atomic" type="xs:boolean" default="false"/>
```

Restrictions:

If the command with the Atomic attribute set to ‘true’ completed successfully, then the normal Status for the command should be returned.

If an error occurs while performing a command within a Sync command specified with an Atomic attribute, then the (507) Atomic failed exception condition is created by the Sync command. The error status code indicates the failure of the complete command. Separate, individual error status code can also be created that identify specific errors that created the failure.

If a client can execute all the atomic commands together (and thus guarantee the result) then a client MAY split the responses up over multiple messages. If a client cannot execute all the atomic commands together (and thus cannot guarantee the results of commands not executed) and Status responses would go into multiple messages, then the Sync command MUST fail with status code (517) Atomic response too large to fit in message. Previously executed commands within the Sync command MUST be rolled back.

Example:

```xml
<Sync CmdID="1234" Atomic="true">
  <Add CmdID="1235">
    <Cred>
      <Meta Type="syncml:auth-md5" Format="b64"/>
    </Cred>
  </Add>
</Sync>
```
<Data>Zz6EivR3yeaaENcRN6lpAQ==</Data>
</Cred>
<Item>
  <TargetClientURI>./Foo/pen</TargetClientURI>
  <Data>Yes</Data>
</Item>
</Add>
<Replace CmdID="12346">
  <Cred>
    <Meta Type="syncml:auth-md5" Format="b64"/>
    <Data>Zz6EivR3yeaaENcRN6lpAQ==</Data>
  </Cred>
  <Item>
    <TargetClientURI>./Foo/version</TargetClientURI>
    <Data>20000401T133000Z</Data>
  </Item>
</Replace>
</Sync>

6.2.5 AuthName

Usage: Specifies the user name for authentication.

Parent Element: Cred

Content Model:

```
<xs:attribute name="AuthName" type="xs:string"/>
```

Restrictions:

For Authentication schemes which do not contain an extractable user identifier, the AuthName attribute is used to hold a user specific identifier.

6.2.6 Behaviour

Usage: Species the behaviour for the current sync session.

Parent Element: SyncType

Content Model:

```
<xs:attribute name="Behaviour">
  <xs:simpleType>
    <xs:restriction base="xs:string">
      <xs:enumeration value="Preserve"/>
      <xs:enumeration value="Refresh"/>
    </xs:restriction>
  </xs:simpleType>
</xs:attribute>
```

Restrictions:

The Behaviour attribute specify the behaviour for the current sync session.

The semantics of Direction, Behaviour, IDValidity and ChangeLogValidity are described in [DSPRO].
6.2.7 Chal

Usage: Specifies an authentication challenge. The recipient of the challenge specifies authentication credentials, of the given authentication scheme and encoding, in the next request.

Parent Elements: Status, SyncHdr

Content Model:

```xml
<xs:element name="Chal" type="ChalType"/>
<xs:complexType name="ChalType">
  <xs:sequence>
    <xs:element ref="Meta"/>
    <xs:element ref="NextNonce" minOccurs="0"/>
  </xs:sequence>
</xs:complexType>
```

Restrictions:

The `Meta` element’s `Type` and `Format` attributes specify the authentication scheme type and credential encoding style, respectively. The optional `NextNonce` element is only used in SHA-256 authentication scheme to specify the new nonce. The next nonce will be used for authentication when the next sync session is started. The next nonce is provided to make sure the nonce is used only once to avoid an easy eavesdropping of the communication.

A challenge can be specified against the DS server or datastore. To challenge a DS server, a `Chal` element is sent in the `Status` command corresponding to the `SyncHdr` of the associated SyncML request. To challenge a datastore, the `Chal` element is sent in the `Status` command corresponding to the `SyncAlert` or `Sync` command associated with the database.

When the `Chal` element is specified in the `SyncHdr` element, it can be used to update the next nonce to the other side. When the client or server determines to update the next nonce to the other side, the sender can generate the new next nonce and send it in `SyncHdr/Chal/NextNonce` to the receiver, and the receiver updates the old nonce using the received next nonce. The recipient MUST successfully authenticate the credential information in `SyncHdr` before accepting the nonce update. If more than one nonce is transmitted during the session, the latest one MUST be used for the next session.

If absent and if the status code is (200) Command completed successfully, then the same credentials SHALL be used in the next SyncML request.

If absent and if the status code is (212) Authentication accepted, then credentials need not be specified for any subsequent SyncML requests within the current session. The session is authenticated.

Example: The following is a SHA-256 authentication challenge.

```xml
<Status CmdID="1" CmdRef="0" Code="407" MsgRef="1" Cmd="SyncHdr">
  <Chal>
    <Meta Format="b64" Type="syncml:auth-sha256"/>
    <NextNonce>Tm9uY2U=</NextNonce>
  </Chal>
</Status>
```

6.2.8 ChangeLogValidity

Usage: Specifies if the change log is valid.

Parent Element: SyncType

Content Model:

```xml
<x:attribute name="ChangeLogValidity" type="xs:boolean"/>
```
Restrictions:

The ChangeLogValidity attribute specifies if the change log is valid.

The semantics of Direction, Behaviour, IDValidity and ChangeLogValidity are described in [DSPRO].

6.2.9 ClientURI

Usage: Specifies the SourceClientURI or TargetClientURI referenced by a Status or Results element, or the new Client LUID assigned to the associated ServerURI.

Parent Elements: StatusItem, Status, Results

Content Model:

```
<xs:element name="ClientURI" type="URIWithFPType"/>
```

Restrictions:

When specified in the Status element, specifies the client address specified in the command associated with the response status. When specified in the StatusItem element, specifies the client address specified in the specific Item, or the new client identifier for the server address specified in the Item. When specified in the Results element, specifies the client address specified in the associated Get command.

The element MUST be specified in a Status command corresponding to any SyncML command that includes the SourceClientURI or TargetClientURI element.

Example:

```
<Status CmdID="4321" MsgRef="1" CmdRef="1234" Cmd="Add" Code="200">
  <ServerURI>ABC012345_1012</ServerURI>
  <ClientURI>1012</ClientURI>
</Status>
```

6.2.10 Cmd

Usage: Specifies the name of the SyncML command referenced by a Status element.

Parent Element: Status

Content Model:

```
<xs:attribute name="Cmd">
  <xs:simpleType>
    <xs:restriction base="xs:string">
      <xs:enumeration value="Add"/>
      <xs:enumeration value="Alert"/>
      <xs:enumeration value="Copy"/>
      <xs:enumeration value="Delete"/>
      <xs:enumeration value="Get"/>
      <xs:enumeration value="Move"/>
      <xs:enumeration value="Put"/>
      <xs:enumeration value="Replace"/>
      <xs:enumeration value="Results"/>
      <xs:enumeration value="Status"/>
      <xs:enumeration value="Sync"/>
      <xs:enumeration value="SyncAlert"/>
      <xs:enumeration value="SyncHdr"/>
    </xs:restriction>
  </xs:simpleType>
</xs:attribute>
```
Restrictions:
The value MUST be one of "Add", "Alert", "Copy", "Delete", "Get", "Move", "Put", "Replace", "Results", "Status", "Sync", "SyncAlert" when the CmdRef attribute has a value greater than "0" or be "SyncHdr" when the CmdRef attribute has a value of "0".

Example:

```xml
<Status CmdID="4321" MsgRef="1" CmdRef="1234" Cmd="Add">
  ...
</Status>
```

### 6.2.11 CmdID

**Usage:** Specifies a SyncML message-unique command identifier. This is a positive integer used to uniquely reference the Protocol Management Elements [6.1.4] or Protocol Command Elements [6.1.5] in a message. Generally, this is referenced in the CmdRef attribute of a Results or Status element.

**Parent Elements:** Add, Alert, Copy, Delete, Get, Move, Put, Replace, Results, Status, Sync, SyncAlert

**Content Model:**

```xml
<xs:attribute name="CmdID" type="xs:positiveInteger"/>
```

**Restrictions:**
The value MUST be unique within each SyncML Message.

**Example:**

```xml
<Add CmdID="1234">
  <Cred>
    <Meta Type="syncml:auth-md5" Format="b64"/>
    <Data>Zz6EivR3yeaaENcRN6lpAQ==</Data>
  </Cred>
  <Item>
    <SourceClientURI>./12</SourceClientURI>
    <Meta Type="text/directory;profile=vCard"/>
    <Data>BEGIN:VCARD
      VERSION:3.0
      FN:Smith;Bruce
      N:Bruce Smith
      TEL;TYPE=WORK;VOICE:+1-919-555-1234
    END:VCARD
    </Data>
  </Item>
</Add>
```

### 6.2.12 CmdRef

**Usage:** Specifies the CmdID referenced by a Results or Status element.
**Parent Elements:** Results, Status

**Content Model:**

```xml
<xs:attribute name="CmdRef" type="xs:nonNegativeInteger"/>
```

**Restrictions:**

The `CmdRef` attribute MUST refer to the identifier of the SyncML command referenced by the Results or Status element.

The value “0” refers to the SyncHdr of the corresponding message.

**Example:**

```xml
<Status CmdID="4321" MsgRef="1" CmdRef="1234" Cmd="Add" Code="401">
  <Chal>
    <Meta Format="b64" Type="syncml:auth-md5"/>
    <NextNonce>ZG9iZWhhdmUNCg==</NextNonce>
  </Chal>
</Status>
```

### 6.2.13 Code

**Usage:** Specifies a status code or alert code.

**Parent Elements:** Alert, Status

**Content Model:**

```xml
<xs:attribute name="Code" type="xs:positiveInteger"/>
```

**Restrictions:**

This attribute is used to specify a status code or alert code.

**Example:**

```xml
<Alert CmdID="1234" Code="222"/>
```

### 6.2.14 CommonOperationType

**Usage:** Specifies the complex type for the SyncML commands which have the common operation type.

**Parent Elements:** Add, Copy, Get, Move, Put

**Content Model:**

```xml
<xs:complexType name="ComplexOperationType">
  <xs:sequence>
    <xs:element ref="Cred" minOccurs="0"/>
    <xs:element ref="Meta" minOccurs="0"/>
    <xs:element ref="Item" maxOccurs="unbounded"/>
  </xs:sequence>
  <xs:attribute ref="CmdID" use="required"/>
  <xs:attribute ref="NoStatus" use="optional"/>
</xs:complexType>
```

**Example:**

```xml
```
6.2.15 Copy

Usage: Specifies the SyncML command to copy data items from one location (data store and/or folder) to another in the recipient's database.

Parent Elements: Sync, SyncBody

Content Model:

```
<xs:element name="Copy" type="CommonOperationType"/>
```

Restrictions:

It is implementation dependent whether a physical copy of the item is made in the recipient, or whether a shortcut or pointer is created to the source item in the target location.

The Copy command in this version of the specification is NOT intended to be used to attempt to change the MIME content type of a data item, compress the data item or otherwise transform a target data item. Both the source and target locations MUST support the MIME content type of the data item. The result of any differences between the supported field lists of different datastores is undefined.

One or more Item element types MUST be specified. The Item element type specifies the data item to be copied on the recipient's database. Any Data specified in Item SHOULD be ignored by the recipient. The source data item, and the source and target parent datastores and folders MUST exist.

If specified within a Sync element type to reference items within the current datastore, a TargetServerURI, TargetClientURI, SourceServerURI, or SourceClientURI specified within the Item element type in the Copy command SHOULD be a relative URI, as relative to the corresponding TargetServerURI / TargetClientURI or SourceServerURI / SourceClientURI specified in the parent Sync command.

If specified within a Sync element type to reference items outside the current datastore, a TargetServerURI, TargetClientURI, SourceServerURI or SourceClientURI specified within the Item element type in the Copy command SHOULD be a relative URI, as relative to the corresponding TargetClientParentURI or SourceClientParentURI, which SHOULD be an absolute URI.

If specified within a SyncBody element type, a TargetServerURI, TargetClientURI, or SourceClientURI specified within the Item element type in the Copy command SHOULD be a relative URI, as relative to the corresponding TargetClientParentURI or SourceClientParentURI, which SHOULD be an absolute URI.

When specified by the client, Item elements of Copy commands MUST only contain client identifiers (SourceClientURI, SourceClientParentURI, TargetClientURI, and TargetClientParentURI). Note the implication that any item created by the server must be mapped by the client before it can be referenced by the client.

When specified by the server, Item elements of Copy commands MUST contain a TargetServerURI and MUST NOT contain a TargetClientURI. TargetServerParentURI and SourceServerParentURI SHOULD only be used within a Sync command, and SHOULD be relative URIs, as relative to the corresponding TargetServerURI / TargetClientURI or SourceServerURI / SourceClientURI specified in the parent Sync command. Note the implication that servers cannot Copy to or from folders outside the current datastore that have not been mapped by the client. This is to reduce complexity, by avoiding ambiguous parent addresses of the form "./LUID/LUID/GUID/GUID".

The Item element for each object MUST include parent information for both the source and the target location.

When the client is the recipient, it MAY assign new local identifiers (LUIDs) for the data items specified in this command. However, in such cases the client MUST also notify the server of the item identifier correlation by returning the new LUID in the corresponding StatusItem element.
### Source/Target Combinations

<table>
<thead>
<tr>
<th>Source/Target Combinations</th>
<th>Valid inside Sync or SyncBody</th>
<th>Only Valid in Sync</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Valid within single or multiple datastores</td>
<td>Only Valid within the current datastore (relative Parent URIs)</td>
</tr>
<tr>
<td></td>
<td>Example 1/2</td>
<td>Example 3/4</td>
</tr>
<tr>
<td>Sender</td>
<td>Client</td>
<td>Server</td>
</tr>
<tr>
<td>SourceServerURI</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>SourceClientURI</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>TargetServerURI</td>
<td>-</td>
<td>x</td>
</tr>
<tr>
<td>TargetClientURI</td>
<td>x</td>
<td>-</td>
</tr>
</tbody>
</table>

Use Relative URIs for object identifiers.

When Inside Sync, use Relative URIs for Parent Identifiers within the same datastore. When Inside SyncBody, or to reference other datastores, use Absolute URIs for the Parent Identifiers.

| SourceServerParentURI (Relative URI only) | - | - | - | - | x | x |
| SourceClientParentURI               | x | x | x | x | x | - | - |
| TargetServerParentURI (Relative URI only) | - | - | - | x | x | - | x |
| TargetClientParentURI               | x | x | x | - | - | x | - |

**Table 9: Copy Source/Target Combinations**

### Status Codes:

If the command completed successfully, then the \((201)\) Item added exception condition is created by the command.

If the originator's authentication credentials specify a principal with insufficient rights to complete the command, then the \((401)\) Unauthorized exception condition is created by the command. If no authentication credentials were specified, then \((407)\) Authentication required exception condition is created by the command. A suitable challenge can also be returned.

If the target data item already exists in the recipient database, then the \((418)\) Already exists exception condition is created by the command.

If there is insufficient space in the recipient database for the data item, then the \((420)\) Device full exception condition is created by the command, and the originator SHOULD NOT attempt to add additional data until the recipient has more free space.

Non-specific errors created by the recipient while attempting to complete the command create the \((500)\) Command failed exception condition.

If an error occurs while the recipient copying the data item within the recipient's database, then the \((510)\) Data store failure exception condition is created by the command.
Example 1: The client requests the server to copy an item (LUID 1001) from the top level folder to a different folder (LUID 1013), within the same datastore, assigning it the new LUID 1007, within a Sync command.

```
<Copy CmdID="301">
  <Item>
    <TargetClientURI>1007</TargetClientURI>
    <SourceClientURI>1001</SourceClientURI>
    <TargetClientParentURI>1013</TargetClientParentURI>
    <SourceClientParentURI>./</SourceClientParentURI>
  </Item>
</Copy>
```

Example 2: The client requests the server to copy an item (LUID 1002) from the top level folder of the ./Contacts datastore to a different folder (LUID 1008), within the ./Archive datastore, assigning it the new LUID 1010, outside of a Sync command.

```
<Copy CmdID="302">
  <Item>
    <TargetClientURI>1010</TargetClientURI>
    <SourceClientURI>1002</SourceClientURI>
    <TargetClientParentURI>./Archive/1008</TargetClientParentURI>
    <SourceClientParentURI>./Contacts</SourceClientParentURI>
  </Item>
</Copy>
```

Example 3: The server requests the client to copy an existing, mapped item (LUID 1001) from the top level folder of one datastore to a different existing, mapped folder (LUID 1008) in the ./Archive datastore, assigning it a GUID of ABC012345_1011, inside of a Sync command.

```
<Copy CmdID="303">
  <Item>
    <TargetServerURI>ABC012345_1011</TargetServerURI>
    <SourceClientURI>1001</SourceClientURI>
    <TargetClientParentURI>./Archive/1008</TargetClientParentURI>
    <SourceClientParentURI>./</SourceClientParentURI>
  </Item>
</Copy>
```

Example 4: The server requests the client to copy an existing, mapped item (LUID 1002) from the top level folder of one datastore to a different existing, mapped folder (LUID 1013) in the same datastore, assigning it a GUID of ABC012345_1012, outside of a Sync command.

```
<Copy CmdID="304">
  <Item>
    <TargetServerURI>ABC012345_1012</TargetServerURI>
    <SourceClientURI>1002</SourceClientURI>
    <TargetClientParentURI>./Contacts/1004</TargetClientParentURI>
    <SourceClientParentURI>./Contacts</SourceClientParentURI>
  </Item>
</Copy>
```

Example 5: The server requests the client to copy an existing but unmapped item (GUID ABC012345_1003) from the top level folder of the current datastore to a different existing, mapped folder (LUID 1004) in the same datastore, assigning it a GUID of ABC012345_1013, inside of a Sync command.

```
<Copy CmdID="305">
  <Item>
    <TargetServerURI>ABC012345_1003</TargetServerURI>
    <SourceClientURI>1003</SourceClientURI>
    <TargetClientParentURI>./Contacts/1004</TargetClientParentURI>
    <SourceClientParentURI>./Contacts</SourceClientParentURI>
  </Item>
</Copy>
```
Example 6: The server requests the client to copy an existing but unmapped item (GUID ABC012345_1003) from the top level folder of a datastore to a different existing, mapped folder (LUID 1008) in a different datastore, assigning it a GUID of ABC012345_1014, outside of a Sync command.

Example 7: The server requests the client to copy an existing mapped item (LUID 1001) from the top level folder to an existing, unmapped folder (GUID ABC012345_1005), assigning it a GUID of ABC012345_1015, inside of a Sync command.

Example 8: The server requests the client to copy an existing unmapped item (GUID ABC012345_1003) from the top level folder to an existing, unmapped folder (GUID ABC012345_1005), assigning it a GUID of ABC012345_1016, inside of a Sync command.

Example 9: The server requests the client to copy an existing unmapped item (GUID ABC012345_1006) from an existing unmapped folder (GUID ABC012345_1005) to an existing, mapped folder (LUID 1013), assigning it a GUID of ABC012345_1017, inside of a Sync command.
<TargetServerURI>ABC012345_1017</TargetServerURI>
<SourceServerURI>GUID ABC012345_1006</SourceServerURI>
<TargetClientParentURI>1013</TargetClientParentURI>
<SourceServerParentURI>GUID ABC012345_1005</SourceServerParentURI>
</Item>
</Copy>

Example 10: The server requests the client to copy an existing unmapped item (GUID ABC012345_1006) from an existing unmapped folder (GUID ABC012345_1005) to an the same existing unmapped folder (GUID ABC012345_1006), assigning it a GUID of ABC012345_1018, inside of a Sync command.

<Copy CmdID="310">
  <Item>
    <TargetServerURI>ABC012345_1018</TargetServerURI>
    <SourceServerURI>GUID ABC012345_1006</SourceServerURI>
    <TargetServerParentURI>GUID_ABC012345_1005</TargetServerParentURI>
    <SourceServerParentURI>GUID ABC012345_1005</SourceServerParentURI>
  </Item>
</Copy>

6.2.16 Correlator

Usage: Specifies a link between two related SyncAlert commands.

Parent Element: SyncAlert

Content Model:

```xml
<xs:attribute name="Correlator" type="xs:string"/>
```

Restrictions:
None

6.2.17 Cred

Usage: Specifies an authentication credential for the originator.

Parent Elements: Add, Alert, Copy, Delete, Get, Put, Move, Replace, Status, Sync, SyncAlert, SyncHdr

Content Model:

```xml
<xs:element name="Cred" type="CredType"/>
<xs:complexType name="CredType">
  <xs:sequence>
    <xs:element ref="Meta"/>
    <xs:element ref="Data"/>
  </xs:sequence>
  <xs:attribute ref="AuthName" use="optional"/>
</xs:complexType>
```

Restrictions:
The Meta Type and Format attributes specify the authentication scheme and credential encoding style, respectively. The value of the Data element specifies the credential. For authentication schemes which do not contain an extractable user identifier, the AuthName attribute is used to hold a user specific identifier.

Credentials SHOULD be processed from the SyncML message level (supplied on the SyncHdr), down to the datastore level (supplied on a SyncAlert or Sync command), down to the individual command. Credential failure at the message level should stop lower level credential checking until that has been resolved.

The Data Sync Client and Server MUST support the following authentication scheme:

<table>
<thead>
<tr>
<th>Name</th>
<th>Authentication Scheme</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHA-256</td>
<td>syncml:auth-sha256</td>
<td>SHA-256 hash-function based authentication scheme.</td>
</tr>
</tbody>
</table>

SHA-256 authentication scheme provides a safe way for prevention of replay attacks to transmit the credential in SHA-256 digest to the recipient. When SHA-256 authentication scheme is used, the value of Meta Type and Format attributes SHALL be 'syncml:auth-sha256' and 'b64', respectively. The value of Data element is the digest which SHALL be computed as following:

Let H = the SHA-256 Hashing function.
Let Digest = the output of the SHA-256 Hashing function.
Let B64 = the base64 encoding function.
Let userid = User Identifier.
Let secret = Secret known by the originator and recipient.
Let nonce = Challenge specified by the recipient

Digest = H(B64(H(userid:secret):nonce))

If absent, and no other authentication credential was specified in either a parent command or in the SyncHdr element, then no authentication credential is specified.

If an authentication credential was specified by a parent command or in the SyncHdr element, then that authentication credential specified there is assumed to be sufficient for the operation specified by the current element. Specifying insufficient authentication credentials will result in a '(401) Unauthorized' exception condition.

If the authentication challenge is received for the request, the authentication scheme and encoding of the next request SHALL be applied to it.

The DS Client and Server MAY support the following authentication schemes (not the definitive list):

<table>
<thead>
<tr>
<th>Name</th>
<th>Authentication Scheme</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHA-1</td>
<td>syncml:auth-sha1</td>
<td>SHA-1 hash-function based authentication scheme.</td>
</tr>
<tr>
<td>MD5</td>
<td>syncml:auth-md5</td>
<td>MD5 hash-function based authentication scheme.</td>
</tr>
<tr>
<td>X509</td>
<td>syncml:auth-x509</td>
<td>The data would be an actual X.509 Certificate. The data SHOULD be sent raw in WBXML, and base64 encoded in XML.</td>
</tr>
<tr>
<td>Securid</td>
<td>syncml:auth-securid</td>
<td>The data specific for SecurID authentication would be sent. The data SHOULD be sent raw in WBXML, and base64 encoded in XML.</td>
</tr>
</tbody>
</table>
Safeword

**syncml:auth-safeword**

The data specific for SafeWord authentication would be sent. The data SHOULD be sent raw in WBXML, and base64 encoded in XML.

Digipass

**syncml:auth-digipass**

The data specific for DigiPass authentication would be sent. The data SHOULD be sent raw in WBXML, and base64 encoded in XML.

Other authentication schemes MAY be specified by prior agreement between the originator and the recipient, which is out of the scope of this document.

**Example:** The following is an example of a SHA-256 authentication scheme:

```xml
<Cred AuthName="Bruce">
    <Meta Format="b64" Type="syncml:auth-sha256"/>
    <Data>  --actual data goes here-- </Data>
</Cred>
```

### 6.2.18 Data

**Usage:** Specifies discrete SyncML data.

**Parent Elements:** Cred, Item

**Content Model:**

```xml
<xs:element name="Data" type="DataType"/>
<xs:complexType name="DataType">
    <xs:simpleContent>
        <xs:extension base="xs:string">
            <xs:attribute ref="Encrypted" use="optional"/>
        </xs:extension>
    </xs:simpleContent>
</xs:complexType>
```

**Restrictions:**

The content information can be either parsable character data or mark-up data. If the element type contains any mark-up, then the name space for the element types MUST be declared on the element types in the content information.

The optional *Encrypted* attribute specifies whether or not the content data is encrypted.

When specified in a Cred, the element type specifies the authentication credentials.

When specified in an Item, the element type specifies the item data.

**Example 1:** The following is an example of an Item with data that does not contain any mark-up.

```xml
<Item>
    <Data>John Smith, +1-919-555-1234</Data>
</Item>
```

**Example 1:** The following is an example of an Item with data that does contain meta-information mark-up data.

```xml
<Item>
    <Meta Format="xml" Type="application/vnd.syncml-devinf+xml"/>
</Item>
```
6.2.19  Delete

Usage: Specifies the SyncML command to delete data from a data collection.

Parent Elements: Sync, SyncBody

Content Model:

```xml
<xs:element name="Delete" type="DeleteType"/>
<xs:complexType name="DeleteType">
  <xs:sequence>
    <xs:element ref="Cred" minOccurs="0"/>
    <xs:element ref="Item" maxOccurs="unbounded"/>
  </xs:sequence>
  <xs:attribute ref="CmdID" use="required"/>
  <xs:attribute ref="SftDel" use="optional"/>
  <xs:attribute ref="NoStatus" use="optional"/>
</xs:complexType>
```

Restrictions:

The Delete command is generally used to permanently erase data items from the recipient's database. However, the command can also be used to temporarily remove data items from the recipient's database in order to create room for a subsequent Add command. This is termed a "soft delete".

One or more Item element types MUST be specified. The Item element type specifies the data item deleted from the database. The TargetClientURI or SourceClientURI specified within the Item element type is a client identifier (LUID), as relative to the corresponding TargetServerURI/TargetClientURI or SourceServerURI/SourceClientURI specified in the parent Sync command.

TargetServerURI, SourceServerURI, TargetServerParentURI, TargetClientParentURI, SourceServerParentURI or SourceClientParentURI MUST NOT be specified in a Delete command. If the client wishes to delete an item that has not yet been mapped, it must first send the new LUID in the corresponding StatusItem element of the item to be deleted. The Server MUST NOT attempt to delete an item before the client has had an opportunity to send a new LUID in the StatusItem element (E.g. Adding an item, and then immediately deleting the same item by the GUID is prohibited).

In applications (e.g., email) where the "delete" concept involves "moving" a data item from one folder to a special "Deleted" folder, this can be achieved either by the Move command, or by using either the Copy command or the Add command to propagate the specified data item to the "Deleted" folder, followed by the subsequent Delete of the corresponding item from the original folder.
The recipient of a Delete command can delete any subset of the specified data elements. However, if all of the requested data was not deleted, then the (206) Partial content exception condition is created by the command. If a Status command is returned for this exception condition, then the identifiers of the data items not deleted SHOULD be returned also.

If the recipient determines that the data item doesn’t exist on the recipient’s database, then the (211) Item not deleted exception condition is created by the command.

If the originator’s authentication credentials specify a principal with insufficient rights to complete the command, then the (401) Unauthorized exception condition is created by the command. If no authentication credentials were specified, then (407) Authentication required exception condition is created by the command. A suitable challenge can also be returned.

In synchronization protocol cases where the client sends a new LUID for the GUID in a StatusItem element, the server MUST always specify the client identifier for any data items to be deleted. Otherwise, the (412) Incomplete command exception condition is created and no data items will be deleted by the client.

The Delete command can be used to delete an interior node and all of its child nodes. If a Delete is received for a parent node which still contains child items, the child items are also deleted.

Non-specific errors created by the recipient while attempting to complete the command create the (500) Command failed exception condition.

Example 1: The client requests the server to delete an item, with credentials that provide delete access to the item in the current datastore. The item is identified by the client LUID.

```xml
<Delete CmdID="401">
  <Cred>
    <Meta Type="syncml:auth-md5" Format="b64"/>
    <Data>Zz6EivR3yeaaENcRN6lpAQ==</Data>
  </Cred>
  <Item><SourceClientURI>1001</SourceClientURI></Item>
</Delete>
```

The following is an example to “soft delete” a number of data items to allow room on the device for a subsequent Add or Copy command, not specified in this example.

Example 2: The client informs the server that it has Soft Deleted a set of items to free storage on the device. The items are identified by client LUIDs.

```xml
<Delete CmdID="402" SftDel="true">
  <Item><SourceClientURI>1015</SourceClientURI></Item>
  <Item><SourceClientURI>1016</SourceClientURI></Item>
  <Item><SourceClientURI>1017</SourceClientURI></Item>
</Delete>
```

Example 3: The server requests the client to Soft Delete a set of items to free storage on the device. The items are identified by client LUIDs.

```xml
<Delete CmdID="403" SftDel="true">
  <Item><TargetClientURI>1018</TargetClientURI></Item>
  <Item><TargetClientURI>1019</TargetClientURI></Item>
  <Item><TargetClientURI>1020</TargetClientURI></Item>
</Delete>
```
6.2.20 Direction

Usage: Specifies the sync direction.

Parent Element: SyncType

Content Model:

```xml
<xs:attribute name="Direction">
  <xs:simpleType>
    <xs:restriction base="xs:string">
      <xs:enumeration value="fromClient"/>
      <xs:enumeration value="fromServer"/>
      <xs:enumeration value="twoWay"/>
      <xs:enumeration value="NoWay"/>
    </xs:restriction>
  </xs:simpleType>
</xs:attribute>
```

Restrictions:

The `Direction` attribute specifies the sync direction.

The semantics of `Direction`, `Behaviour`, `IDValidity` and `ChangeLogValidity` are described in [DSPRO].

6.2.21 EmptyType

Usage: This type definition is used in the Syntax Elements definition. And it is used to specify an empty type for the Element that has no element, attribute or content.

Used for Elements: Final, MoreData

Content Model:

```xml
<xs:complexType name="EmptyType"/>
```

Example:

```xml
<Item>
  <xs:element name="Final" type="EmptyType"/>
</Item>
```

6.2.22 Encrypted

Usage: Specifies whether or not the data is encrypted.

Parent Element: Data

Content Model:

```xml
<xs:attribute name="Encrypted" type="xs:boolean" default="false"/>
```

Restrictions:

This attribute specifies whether or not the content information in the `Data` element is encrypted using the encrypted symmetry key transmitted in `SyncHdr`.

Example: The following is an example of an Item with data that does not contain any mark-up.

```xml
<Item>
</Item>
```
6.2.23 EncryptedKey

Usage: Specifies encrypted symmetric key and key information for the originator.

Parent Element: SyncHdr

Content Model:

```xml
<xs:element name="EncryptedKey" type="CredType"/>
```

Restrictions:

The Meta Type and Size attributes specify the algorithm and length of the symmetric key, respectively. The Meta Format attribute specifies the encoding style for the encrypted octet sequence. The default value for this element is b64. The value of the Data element specifies the encrypted symmetric key using the key exchange algorithm.

Example: The following example illustrates how the encrypted symmetric key is transmitted.

```xml
<SyncHdr>
  ...
  <EncryptedKey>
    <Meta Format="b64" Type="AES-128-CBC" Size="128"/>
    <Data>Zz6EivR3yeaaENcRN6lpAQ==</Data>
  </EncryptedKey>
</SyncHdr>
```

6.2.24 Field

Usage: Specifies a field level filter to be performed on the parent element of the Filter element.

Parent Element: Filter

Content Model:

```xml
<xs:element name="Field" type="FieldType"/>
<xs:complexType name="FieldType">
  <xs:sequence>
    <xs:element ref="Item"/>
  </xs:sequence>
</xs:complexType>
```

Restrictions:

If the Field element is present, the SyncAlert TargetClientURI/TargetServerURI Meta Type is used to indicate the content type used in the content filtering and MUST be present. The Item Meta element is used to indicate the device info MIME type and MUST be present. The Item Data element MUST contain Property elements. The mark-up characters of the Data element content MUST be properly escaped according to [XML] specification rules or the CDATA sections MUST be used. The Property elements MUST be used to override any Property elements previously received in the CTCap element for the content-type being filtered and MUST apply to the current synchronization session only. If no Field element is present in the Filter element, then all properties SHOULd be filtered using the device info data store CTCap element for the specified SyncAlert element.

Example: The following is an example of a Field element used within a Filter element to define the characteristics of the subset of data to be synchronized. The Field element contains a Property element set to “PHOTO” containing a
MaxSize element set to 0 (zero). This indicates to the server that it SHOULD NOT send any PHOTO properties since the client has requested that it wishes to receive only 0 bytes of this property for this synchronization request and the value SHOULD NOT be truncated.

```xml
(Filter
 ...
<Field>
    <Item>
        <Meta Type="application/vnd.syncml-devinf+xml"/>
        <Data><![CDATA[
            <Property>
                <PropName>PHOTO</PropName>
                <PropInfo>
                    <MaxSize Truncate="false">0</MaxSize>
                </PropInfo>
            </Property>
        ]]></Data>
    </Item>
</Field>
...)
```  

### 6.2.25 FieldLevel

**Usage:** Indicates that the content information in the Data element replaces only part of an item.

**Parent Element:** Replace

**Content Model:**

```
<xs:attribute name="FieldLevel" type="xs:boolean" default="false"/>
```

**Restrictions:**

**Example:**

```xml
<Replace CmdID="3" FieldLevel="true">
    <Meta Type="x-type/x-subtype"/>
    <Item>
        <TargetClientURI>244</TargetClientURI>
        <Data>
            ...
        </Data>
    </Item>
</Replace>
```

### 6.2.26 Filter

**Usage:** Specifies a filter action to be performed on the parent element.

**Parent Element:** Get, SyncAlert

**Content Model:**

```
<x:s:element name="Filter" type="FilterElementType"/>
<x:s:complexType name="FilterElementType">
    <xs:sequence>
        <xs:element ref="Meta"/>
        <xs:element ref="Field" minOccurs="0"/>
    </xs:sequence>
</x:s:complexType>
```

© 2008 Open Mobile Alliance Ltd. All Rights Reserved.
Used with the permission of the Open Mobile Alliance Ltd. under the terms as stated in this document.
<xs:element ref="Record" minOccurs="0"/>
</xs:sequence>
<xs:attribute ref="FilterType" use="optional"/>
</xs:complexType>

Restrictions:

The Filter element MAY appear in the SyncAlert element. If the Filter element is present, the Meta element’s Type attribute is used to indicate the content type used in the filter query and MUST be present. If the Filter element does not have a Record or a Field element, then the filter request is ignored and synchronization MUST continue without any filtering.

Example: The following is an example of a Filter element which

1. Uses the Record element with a Meta element’s Type value to specify the MIME type the filter applies to.
2. Uses the Item element with a Meta element’s Type value of “syncml:filtertype-cgi” to indicate the grammar being used.
3. Uses the Item Data element to constrain the items synchronized to those that fall into the “business” or “personal” group (case insensitive) with the cgi expression “GROUP&iCON;business&OR; GROUP&iCON;personal”.

```xml
<Filter>
  <Meta Type="Some/MIMType"/>
  <Record>
    <Meta Type="syncml:filtertype-cgi"/>
    <Item>
      <Meta Type="syncml:filtertype-cgi"/>
      <Data><![CDATA[GROUP&iCON;business&OR;GROUP&iCON;personal]]></Data>
    </Item>
  </Record>
</Filter>
```

6.2.27 FilterType

Usage: Indicates the type of filtering behaviour that is being requested. If the requested filter type is not supported by the recipient then a Status code 406 (OPTIONAL feature not supported) MUST be returned. The Item element of the Status command SHOULD indicate that the FilterType attribute was the unsupported feature.

Parent Element: Filter

Content Model:

```xml
<xs:attribute name="FilterType" default="EXCLUSIVE"/>
<xs:simpleType>
  <xs:restriction base="xs:string">
    <xs:enumeration value="EXCLUSIVE"/>
    <xs:enumeration value="INCLUSIVE"/>
  </xs:restriction>
</xs:simpleType>
```

Restrictions:

If present, these keywords MUST be one of the FilterType keywords listed below. If not present, then the FilterType value of “EXCLUSIVE” MUST be assumed.

<table>
<thead>
<tr>
<th>Keywords</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXCLUSIVE</td>
<td>Indicates that the sender is requesting that the set of data items to be synchronized MUST be exactly the set of items</td>
</tr>
</tbody>
</table>
specified by the Filter. Additional items in the data store MUST not be synchronized and the recipient of the Filter MUST request that additional items be removed from the sender device.

| INCLUSIVE | Indicates that the sender is requesting that the set of data items to be synchronized MUST include the set of items specified by the Filter. Additional items in the datastore that are not specified by the Filter MUST not be synchronized and the recipient of the Filter MUST leave these additional items on the sender device. |

Table 1: FilterType keywords

Example: The following is an example of a Filter element which uses the EXCLUSIVE FilterType keyword

```xml
<Filter FilterType="EXCLUSIVE">
  <Meta Type="Some/MIMEType"/>
  <Record>
    <Item>
      <Meta Type="syncml:filtertype-cgi"/>
      <Data><![CDATA[GROUP&iCON;business&OR;GROUP&iCON;personal]]></Data>
    </Item>
  </Record>
</Filter>
```

6.2.28 Final

Usage: Indicator that the SyncML message is the last message in the current SyncML package.

Parent Element: SyncBody

Content Model:

```xml
<xs:element name="Final" type="EmptyType"/>
```

Restrictions:

The element type MUST only be specified on the last message of the SyncML package. If not present, then more messages follow this SyncML message in the current SyncML package.

The OMA DS Protocol specification [DSPRO] specifies the semantics of the different SyncML packages.

Example:

```xml
<SyncML ... >
  <SyncHdr>...blah, blah...</SyncHdr>
  <SyncBody>
    ...blah, blah...
    <Final/>
  </SyncBody>
</SyncML>
```

6.2.29 Format

Usage: Specifies the encoding format of the content information in the Data element.
Parent Element: Meta

Content Model:

```xml
<xs:attribute name="Format" type="xs:string"/>
```

Restrictions:

The value of this attribute SHOULD be one of bin, bool, b64, chr, int, node, null, xml, date, time, or float. If this attribute type is missing, the default value is chr. If the value is bin, then the format of the content is binary data. If the value is bool, then the format of the content is either true or false. If the value is b64, then the format of the content information is binary data that has been character encoded using the Base64 transfer encoding defined by [RFC2045]. If the value is chr, then the format of the content information is clear-text in the character set specified on the transport protocol, the MIME content type header or the XML prolog. If the value is int, then the format of the content information is numeric text representing the integer. If the value is null, then there is no content information. This value is used by some synchronization data models to delete the content, but not the presence of the property. If the value is xml, then the format of the content information is XML structured mark-up data. If the value is date, then the format of the content is in ISO 8601 format with the century being included in the year [ISO8601]. If the value is time, then the format of the content is in ISO 8601 format. If the value is float, then the format of the content is standard concept of real numbers corresponding to a single precision 32 bit floating point type as defined in XML Schema 1.0 as the float primitive type.

In case a Meta element containing a Format attribute contains meta-information about a Data object, this Meta element MUST have the same parent as the Data object it refers to.

The target object is the one in which the meta-information appears.

Example: The following example illustrates how the attribute is used to specify Format meta-information for data in the Item element type.

```xml
<Item>
  <Meta Format="int" Type="text/plain"/>
  <Data>1024</Data>
</Item>
```

6.2.30 FP

Usage: Fingerprints are values associated with particular data item contents. And fingerprints are compared to detect if particular data items have changed.

Parent Elements: SourceClientURI, ID

Content Model:

```xml
<xs:attribute name="FP" type="xs:int"/>
```

Restrictions:

None.

Example:

```xml
<Replace CmdID="3">
  ... ... ...
  <Item>
    <SourceClientURI FP="0568">244</SourceClientURI>
    <Data>...
    </Data>
  </Item>
</Replace>
```
6.2.31 FreeID

Usage: Specifies the number of free item identifiers available for adding new items to the datastore.

Parent Element: Sync

Content Model:

```xml
<xs:attribute name="FreeID" type="xs:unsignedInt"/>
```

Restrictions:

The content information is a decimal integer number.

Example: The following is an example showing 25 free item identifiers

```
FreeID="25"
```

6.2.32 FreeMem

Usage: Specifies the amount of free memory, in bytes, available in the datastore.

Parent Element: Sync

Content Model:

```xml
<xs:attribute name="FreeMem" type="xs:long"/>
```

Restrictions:

The content information is a decimal integer number.

Example: The following is an example showing 1022 free bytes

```
FreeMem="1022"
```

6.2.33 Get

Usage: Specifies the SyncML command to retrieve data from the recipient.

Parent Element: SyncBody

Content Model:

```xml
<xs:element name="Get" type="GetType"/>
<xs:complexType name="GetType">
  <xs:sequence>
    <xs:element ref="Cred" minOccurs="0"/>
    <xs:element ref="Meta" minOccurs="0"/>
    <xs:element ref="Item" maxOccurs="unbounded"/>
    <xs:element ref="Filter" minOccurs="0"/>
  </xs:sequence>
  <xs:attribute ref="CmdID" use="required"/>
  <xs:attribute ref="NoStatus" use="optional"/>
</xs:complexType>
```

Restrictions:
There is no synchronization state information for data retrieved using the Get command. This command MUST NOT be specified within a Sync command.

Data returned from a Get command is returned in a Results element type in a subsequent SyncML message.

One or more Item element types MUST be specified. The Item element type specifies the data items to be returned from the recipient. The TargetServerURI/TargetClientURI and SourceServerURI/SourceClientURI specified within the Item element type SHOULD be an absolute URI.

The optional Filter element specifies the filter criteria applied to the TargetServerURI/TargetClientURI in each Item element.

If the command completed successfully, then the (200) OK exception condition is created by the command.

If the command completed successfully but there is no content to return, then the (204) No content exception condition is created by the command.

If the command completed successfully but only a portion of the content is being returned, with the remainder being returned in subsequent Results commands, then the (206) Partial content exception condition is created by the command.

If the command specifies an ambiguous target with multiple matches, then the (300) Multiple choices exception condition is created by the command.

If the originator's authentication credentials specify a principal with insufficient rights to complete the command, then the (401) Unauthorized exception condition is created by the command. If no authentication credentials were specified, then (407) Authentication required exception condition is created by the command. A suitable challenge can also be returned.

If the specified data item doesn't exist on the recipient, then the (404) Not found exception condition is created by the command.

If the requested data item is too large to be transferred at this time, then the (413) Request entity too large exception condition is created by the command.

Non-specific errors created by the recipient while attempting to complete the command create the (500) Command failed exception condition.

If the MIME content type or content format for the data item is not supported by the recipient, then the (415) Unsupported MIME content type or content format exception condition is created by the command.

Example:

```
<Get CmdID="12345">
  <Cred>
    <Meta Type="syncml:auth-md5" Format="b64"/>
    <Data>Zz6EivR3yeaaENcRN6lpAQ==</Data>
  </Cred>
  <Item>
    <TargetClientURI>./telecom/pb</TargetClientURI>
    <SourceServerURI>http://www.datasync.com/servle</SourceServerURI>
    <Meta Type="text/x-vCard"/>
  </Item>
</Get>
```

6.2.34 ID

Usage: Specifies the identifier of the data item, and optionally specifies the fingerprint of the data item.

Parent Element: IDContainer
6.2.35 IDContainer

Usage: Acts as the placeholder element for one or more ID elements.

Parent Element: SyncAlert

Content Model:

```xml
<xs:element name="IDContainer" type="IDContainerType"/>
<xs:complexType name="IDContainerType">
  <xs:sequence>
    <xs:element ref="ID" maxOccurs="unbounded"/>
  </xs:sequence>
</xs:complexType>
```

Restrictions:

The IDContainer element is used to specify one or more data item identifiers. By using the IDContainer element in a SyncAlert element, the sender can indicate the data item identifiers that the sender wants to send to the receiver, and the receiver can return back the data item identifiers that the receiver wants the sender to send.

Example:

```xml
<SyncAlert CmdID="3">
  ...
  <IDContainer>
    <ID FP="01">LUID001</ID>
    <ID FP="02">LUID002</ID>
    <ID FP="03">LUID003</ID>
  </IDContainer>
  ...
</SyncAlert>
```

6.2.36 IDValidity

Usage: Specifies if the data item IDs are valid.

Parent Element: SyncType

Content Model:
<xs:attribute name="IDValidity" type="xs:boolean"/>

Restrictions:

The IDValidity attribute specifies if the ID is valid.

The semantics of Direction, Behaviour, IDValidity and ChangeLogValidity are described in [DSPRO].

6.2.37 Item

Usage: Specifies a container for item data.

Parent Elements: Add, Alert, Copy, Delete, Field, Get, Put, Move, Record, Replace, Results, Status

Content Model:

```xml
<xs:element name="Item" type="ItemType"/>
<xs:complexType name="ItemType">
  <xs:sequence>
    <xs:choice>
      <xs:element ref="TargetClientURI" minOccurs="0"/>
      <xs:element ref="TargetServerURI" minOccurs="0"/>
    </xs:choice>
    <xs:choice>
      <xs:element ref="SourceClientURI" minOccurs="0"/>
      <xs:element ref="SourceServerURI" minOccurs="0"/>
    </xs:choice>
    <xs:choice>
      <xs:element ref="TargetClientParentURI" minOccurs="0"/>
      <xs:element ref="TargetServerParentURI" minOccurs="0"/>
    </xs:choice>
    <xs:choice>
      <xs:element ref="SourceClientParentURI" minOccurs="0"/>
      <xs:element ref="SourceServerParentURI" minOccurs="0"/>
    </xs:choice>
    <xs:element ref="Meta" minOccurs="0"/>
    <xs:element ref="Data" minOccurs="0"/>
    <xs:element ref="MoreData" minOccurs="0"/>
  </xs:sequence>
</xs:complexType>
```

Restrictions:

If the source URI for the data is an external entity, then the Data element is absent. In this case, the recipient will need to retrieve the data from the specified network location.

The TargetClientURI/TargetServerURI or SourceClientURI/SourceServerURI element types for any of the SyncML commands can be a relative URL. This restriction is not captured by the SyncML Schema.

When specified in an Add, Copy, Delete, Get, Put, Replace, or Results command, the element type specifies the data item that is the operand for the command. One or more Item element types MUST be specified in these commands. The Item element type specifies the data item to be operated on the recipient's database. When these commands are specified within a Sync element type, the TargetServerURI/SourceServerURI within the Item element type SHOULD be a global unique identifier (GUID), and the TargetClientURI/SourceClientURI within the Item element type SHOULD be a local unique identifier (LUID), as relative to the corresponding TargetServerURI/SourceServerURI and TargetClientURI/SourceClientURI specified in the parent Sync command. If specified within a SyncBody element type, the TargetClientURI/TargetServerURI and SourceClientURI/SourceServerURI within the Item element type in these commands SHOULD be an absolute URI.
When specified in an Alert, the element type specifies the parameters for the alert type.

When specified in a Status, the element type specifies additional information about the request status code type. For example, it might specify the component of the request that caused the status condition.

Example:

```xml
<Add CmdID="1">
  <Cred>
    <Meta Type="syncml:auth-md5" Format="b64"/>
    <Data>Zz6EivR3yeaaENCn6lpAQ==</Data>
  </Cred>
  <Item>
    <SourceClientURI>15</SourceClientURI>
    <Meta Type="text/directory profile=vCard"/>
    <Data>BEGIN:VCARD
      VERSION:3.0
      FN:Smith;Bruce
      N:Bruce Smith
      TEL;TYPE=WORK;VOICE:+1-919-555-1234
      END:VCARD
    </Data>
  </Item>
</Add>
```

6.2.38 Last

**Usage:** Specifies the synchronization state information (i.e., sync anchor) for the previous synchronization session.

**Parent Element:** Anchor

**Content Model:**

```xml
<xs:attribute name="Last" type="AnchorType"/>
<xs:simpleType name="AnchorType">
  <xs:union memberTypes="xs:dateTime xs:positiveInteger"/>
</xs:simpleType>
```

**Restrictions:**

The OPTIONAL Last attribute specifies the synchronization anchor for the previous synchronization session.

The value of the Last attribute MUST specify either an UTC based date/time stamp or a monotonically increasing numeric integer. If a date/time stamp, then the text MUST be in the complete representation, basic format defined by ISO8601.

All Last and Next values sent in a synchronization session by a particular sender MUST be of the same type, and MUST be used such that a comparison operation on values can determine older from newer.

Determination of the ordinal sequence of the version of an existing object in the recipient and the version of the object can be made by comparing the content information of the object with the value on the existing object.

**Example:**

```xml
<Anchor Last="2000-08-24T13:30:00Z" Next="2000-08-24T22:13:00Z"/>
```

6.2.39 MaxMsgSize

**Usage:** Specifies the maximum byte size of any response message to a given SyncML request.
Parent Element: SyncHdr

Content Model:

```xml
<xs:attribute name="MaxMsgSize" type="xs:long"/>
```

Restrictions:

The attribute appears in the SyncHdr of a SyncML request to specify the maximum size of any subsequent response messages. The attribute is usually specified by a SyncML client, but can also be specified by a SyncML server.

This attribute value is applicable for the remainder of the synchronization session, unless it is specified again.

The attribute value represents the maximum, decimal byte size of any response message.

Example:

```xml
MaxMsgSize="1023"
```

6.2.40 MaxObjSize

Usage: Specifies the maximum size in bytes of a data object that the device is able to receive.

Parent Elements: SyncAlert, Sync

Content Model:

```xml
<xs:attribute name="MaxObjSize" type="xs:unsignedLong"/>
```

Restrictions:

The attribute appears in a SyncML request to specify the maximum size of the largest object it is capable of receiving in any subsequent response messages. This attribute value is applicable for the remainder of the synchronization session.

The attribute value represents the maximum, decimal byte size without leading zeroes of any object.

Example: Device that can receive a maximum object of 10K bytes.

```xml
MaxObjSize="10240"
```

6.2.41 Meta

Usage: Specifies meta-information about the parent element type.

Parent Elements: Add, Chal, Copy, Cred, Delete, Get, Filter, Item, Move, Put, Replace, Results, Sync

Content Model:

```xml
<xs:element name="Meta" type="MetaType"/>
<xs:complexType name="MetaType">
  <xs:sequence>
    <xs:attribute ref="Format" use="optional"/>
    <xs:attribute ref="Type" use="required"/>
    <xs:attribute ref="Size" use="optional"/>
  </xs:sequence>
</xs:complexType>
```

Restrictions:

When specified in the Chal element, the Meta specifies meta-information about the authentication scheme requested.
When specified in the \texttt{Cred} element, the \texttt{Meta} specifies meta-information about the authentication credential.

When specified in the \texttt{Sync} element, the scope for the meta-information includes all the contained commands, unless the meta-information is overridden by a \texttt{Meta} in a contained command.

When specified in the \texttt{Results} element, the \texttt{Meta} specifies meta-information about the results set.

When specified in the \texttt{Add}, \texttt{Copy}, \texttt{Delete}, \texttt{Get}, and \texttt{Replace} commands, the element type specifies meta-information about the \texttt{SyncML} command. For example, the common MIME content type or content format for all the specified items. The scope of the \texttt{Meta} information is limited to the command.

\textbf{Example:}

```xml
<Item>
  <Meta Format="xml" Type="application/vnd.syncml-devinf+xml"/>
  <Data> <![CDATA[
  <DevInf xmlns='syncml:devinf' Version="2.0">  
    <DevCap>
      <Man>HAL</Man>
      <Model>9000</Model>
      <OEM>Classified</OEM>
      <FwV>1.0Beta</FwV>
      <SwV>1.0Beta</SwV>
      <HwV>1.0Beta</HwV>
      <DevID>HAL 9000</DevID>
      <DevType>server</DevType>
    </DevCap>
    <DataStore>
      ...
    </DataStore>
  </DevInf>]]>
  </Data>
</Item>
```

\textbf{6.2.42 MoreData}

\textbf{Usage:} Indicator that a \texttt{SyncML Data} element is incomplete and there will be one or more subsequent chunks.

\textbf{Parent Element:} \texttt{Item}

\textbf{Content Model:}

```xml
<xs:element name="MoreData" type="EmptyType"/>
```

\textbf{Restrictions:}

The element type MUST be specified on all but the last chunk of \texttt{Data} of an item. If not present, then the item is either contained within a single message or is the closing chunk of the \texttt{Data} item.

\textbf{Example:}

```xml
<Add CmdID="15">
  <Meta Type="text/x-vcard" Size="3000"/>
  <Item>
    <SourceClientURI>2</SourceClientURI>
  <Data>BEGIN:VCARD
    VERSION:2.1
    FN:Bruce Smith
    N:Smith;Bruce
    TEL;WORK;VOICE:+1-919-555-1234
  </Data>
</Item>
```
6.2.43 Move

Usage: Specifies a SyncML command to support moving data items from one location (data store and/or folder) to another in the recipient’s database.

Parent Elements: Sync, SyncBody

Content Model:

```xml
<xs:element name="Move" type="CommonOperationType"/>
```

Restrictions:

The Move command allows for moving items (ex: files, folder, emails, vCards) from their current location to a new location.

The behaviour when the source parent folder and the target parent folder are the same is undefined.

The restrictions, valid source/target combinations, possible errors, and example syntax are identical to the Copy command, with the exception that the original item is no longer present after the Move has occurred, and certain modified status codes shown below.

See Copy.

Status Code differences from Copy:

If the command completed successfully, then the (200) OK exception condition is created by the command, instead of (201) Item added.

If the recipient determines that the data item could not be moved on the recipient’s database, then the (428) Move Failed exception condition is created by the command.

Example: The following is an example of a Move command similar to example 10 from Copy, except with a different set of directories, so as to avoid attempting to move an item to its current position. The server requests the client to move an existing unmapped item (GUID ABC012345_1006) from an existing unmapped folder (GUID ABC012345_1005) to a different existing unmapped folder (GUID ABC012345_TBD, not shown in Appendix B), assigning it a GUID of ABC012345_1019, inside of a Sync command.

```xml
<Move CmdID="410">
  <Cred>
    <Meta Type="syncml:auth-md5" Format="b64"/>
    <Data>Zz6EivR3yeesaENcRN6lpAQ==</Data>
  </Cred>
  <Meta Format="chr" Type="text/x-vcard"/>
  <Item>
    <TargetServerURI>ABC012345_1018</TargetServerURI>
    <SourceServerURI>GUID ABC012345_1006</SourceServerURI>
    <TargetServerParentURI>GUID ABC012345_TBD</TargetServerParentURI>
    <SourceServerParentURI>GUID ABC012345_1005</SourceServerParentURI>
  </Item>
</Move>
```
6.2.44  MsgID

Usage: Specifies a SyncML session-unique identifier for the SyncML Message.

Parent Element: SyncHdr

Content Model:

```
<xs:attribute name="MsgID" type="xs:positiveInteger"/>
```

Restrictions:

The message identifier MUST be unique to the device within the SyncML session. The attribute MUST be specified in the SyncHdr. The value is a monotonically increasing numeric value starting at one (1) for the first message from each device (Client or Server) in the SyncML session. The message identifier specified in a SyncML request MUST be the content of the MsgRef element type in the corresponding SyncML Results or response Status.

Example:

```
<SyncHdr SessionID="1" MsgID="1">
  <TargetServerURI>http://syncml.example.com/</TargetServerURI>
  <SourceClientURI>IMEI:001004FF1234567</SourceClientURI>
</SyncHdr>
```

6.2.45  MsgRef

Usage: Specifies a reference to a SyncML session-unique identifier referenced by a SyncML Results or response Status.

Parent Elements: Results, Status

Content Model:

```
<xs:attribute name="MsgRef" type="xs:positiveInteger"/>
```

Restrictions:

The value MUST reference the message identifier of the SyncML message referred to by the Results or response Status.

Example:

```
<Status CmdID="4321" MsgRef="1" CmdRef="1234" Cmd="Add" Code="200"/>
```

6.2.46  Next

Usage: Specifies the synchronization state information (i.e., sync anchor) for the current synchronization session.

Parent Element: Anchor

Content Model:

```
<xs:attribute name="Next" type="AnchorType"/>
<xs:simpleType name="AnchorType">
  <xs:union memberTypes="xs:dateTime xs:positiveInteger"/>
</xs:simpleType>
```

Restrictions:

© 2008 Open Mobile Alliance Ltd. All Rights Reserved.
Used with the permission of the Open Mobile Alliance Ltd. under the terms as stated in this document.
The REQUIRED Next attribute specifies the synchronization anchor for the current synchronization session.

The value of the Next attribute MUST specify either an UTC based date/time stamp or a monotonically increasing numeric integer. If a date/time stamp, then the text MUST be in the complete representation, basic format defined by ISO8601.

All Last and Next values sent in a synchronization session by a particular sender MUST be of the same type, and MUST be used such that a comparison operation on values can determine older from newer.

Determination of the ordinal sequence of the version of an existing object in the recipient and the version of the object can be made by comparing the content information of the object with the value on the existing object.

Example:

```xml
<Anchor Last="2000-08-24T13:30:00Z" Next="2000-08-24T22:13:00Z"/>
```

### 6.2.47 NextNonce

**Usage:** Specifies the nonce string to be used in any subsequent communication.

**Parent Element:** Chal

**Restrictions:**

The nonce string MUST be further re-formatted using the Base64 algorithm. Terminators or length of Nonce String MUST NOT be included in this re-formatting. The Nonce string MUST be treated as opaque data.

This element type is used to specify the next nonce string that is to be used in any subsequent SyncML message. For example, a SyncML server specifies this element type to tell the SyncML client to change its nonce to a new value.

Nonce strings are used in various authentication schemes, such as “syncml:auth-sha256” and “syncml:auth-md5”.

**Content Model:**

```xml
<xs:element name="NextNonce" type="xs:string"/>
```

**Example:**

```xml
<Chal>
  <Meta Format="b64" Type="syncml:auth-sha256"/>
  <NextNonce>Tm9uY2U=</NextNonce>
</Chal>
```

### 6.2.48 NoStatus

**Usage:** Indicates that the originator does not want a response Status sent back in the response message.

**Parent Elements:** Add, Alert, Copy, Delete, Get, Move, Put, Replace, Sync, SyncAlert, SyncHdr

**Content Model:**

```xml
<xs:attribute name="NoStatus" type="xs:boolean" default="false"/>
```

**Restrictions:**

When specified as “true”, the recipient MUST NOT return a Status command for the associated SyncML command. If specified on the SyncHdr element type, the recipient MUST NOT return Status commands for any of the commands in the current SyncML message.

**Example:**
6.2.49 **NumberOfChanges**

**Usage:** Indicates the total number of changes (the number of Add, Replace and Delete commands) that are going to be sent from sender to recipient during a synchronization session so that the recipient MAY use this information to calculate progress information.

**Parent Element:** Sync

**Content Model:**

```xml
<xs:attribute name="NumberOfChanges" type="xs:unsignedInt"/>
```

**Restrictions:**

The attribute MUST be specified by the server, but only if the client has indicated that it supports `NumberOfChanges`. It MAY be specified by the client. If synchronizations are carried out on more than one datastore (e.g. Contacts & Calendar), then `NumberOfChanges` MUST be specified for each datastore.

**Example:**

```xml
<Sync CmdID="5" NumberOfChanges="20">
  ...
  <TargetServerURI>contacts</TargetServerURI>
  <SourceClientURI>C:\System\data\Contacts.cdb</SourceClientURI>
  ...
</Sync>
```

6.2.50 **Put**

**Usage:** Specifies the SyncML command to transfer data items to a recipient network device or database.

**Parent Element:** SyncBody

**Content Model:**

```xml
<xs:element name="Put" type="CommonOperationType"/>
```

**Restrictions:**

There is no synchronization state information for data transferred using the Put command. This command MUST NOT be specified within a Sync command.
One or more Item element types MUST be specified. The Item element type specifies the data items to be transferred to the recipient. The TargetClientURI/TargetServerURI and SourceClientURI/SourceServerURI specified within the Item element type SHOULD be an absolute URI.

If the command completed successfully, then the (200) OK exception condition is created by the command.

If the originator's authentication credentials specify a principal with insufficient rights to complete the command, then the (401) Unauthorized exception condition is created by the command. If no authentication credentials were specified, then (407) Authentication required exception condition is created by the command. A suitable challenge can also be returned.

If the Put command did not include the size of the data item to be transferred (i.e., in the Meta element’s Size attribute), then the (411) Size required exception condition is created by the command.

If the data item to be transferred is too large (e.g., there are restrictions on the size of data items transferred to the recipient), then the (413) Request entity too large exception condition is created by the command.

If the Size specified in the Meta element type was too large for the recipient (e.g., the recipient does not have sufficient input buffer for the data), then the (416) Requested size too big exception condition is created by the command.

If the MIME content type or content format for the data item is not supported by the recipient, then the (415) Unsupported MIME content type or content format exception condition is created by the command.

If the recipient device storage is full, then the (420) Device full exception condition is created by the command, and the originator SHOULD NOT attempt to add additional data until the recipient has more free space.

Non-specific errors created by the recipient while attempting to complete the command create the (500) Command failed exception condition.

Example: The following is an example of a Put command used to exchange device information.

```xml
<Put CmdID="12345">
  <Cred>
    <Meta Type="syncml:auth-md5" Format="b64"/>
    <Data>Zz6EivR3yeaaENcRN6lpAQ==</Data>
  </Cred>
  <Meta Type="application/vnd.syncml-devinf+xml"/>
  <Item>
    <SourceClientURI>./devinf20</SourceClientURI>
    <Data><![CDATA[
      <DevInf xmlns='syncml:devinf20' Version="2.0">
        ...
      </DevInf>]]></Data>
  </Item>
</Put>
```

6.2.51 Record

Usage: Specifies a record level filter to be performed on the parent element of the Filter element.

Parent Element: Filter

Content Model:

```xml
<xs:element name="Record" type="RecordType"/>
<xs:complexType name="RecordType">
  <xs:sequence>
    <xs:element ref="Item"/>
  </xs:sequence>
</xs:complexType>
```
Restrictions:

The Record element MAY appear in the Filter element for SyncAlert elements. If the Record element is present, the SyncAlert TargetServerURI/TargetClientURI Meta Type is used to indicate the content type used in the filter record query and MUST be present. The Record Item element specifies the filter query itself. The Record Item Meta Type element is used to indicate the filter query grammar. The Record Item Data is used to indicate the filter query itself and MUST be present.

Example: The following is an example of a Record element used within a Filter element to define the characteristics of the subset of data to be synchronized.

1. The Meta Type value of “syncml:filtertype-cgi” indicates the grammar being used.
2. The Item Data element constrains the items synchronized to those that fall into the “business” or “personal” group (case insensitive) with the cgi expression “GROUP&iCON;business&OR; GROUP &iCON;personal”.

6.2.52 Replace

Usage: Specifies the SyncML command to replace data.

Parent Elements: Sync, SyncBody

Content Model:

```
<xs:element name="Replace" type="ReplaceType"/>
<xs:complexType name="ReplaceType">
  <xs:sequence>
    <xs:element ref="Cred" minOccurs="0"/>
    <xs:element ref="Meta" minOccurs="0"/>
    <xs:element ref="Item" maxOccurs="unbounded"/>
  </xs:sequence>
  <xs:attribute ref="CmdID" use="required"/>
  <xs:attribute ref="FieldLevel" use="optional"/>
  <xs:attribute ref="NoStatus" use="optional"/>
</xs:complexType>
```

Restrictions:

The Replace command is used to replace data on the recipient. The Replace may be either partial (field-level Replace) or full.

If the specified data item does not exist on a server, then the command from a client MUST be interpreted as an Add command. Servers MUST NOT use the Replace command to create new data items on the client. The Replace command MUST NOT be used to Move data items between folders.

The originator of the command SHOULD only send features/properties of the data item that are supported by the recipient. The device information document of the recipient can contain this information.
If the Replace is used for partial update (field-level Replace), then the FieldLevel attribute MUST be used.

If the FieldLevel attribute is included in the Replace element, and the value is "true", then:

- The sender MAY include unchanged fields of the item inside the Data element.
- The recipient MUST NOT remove any fields of the item in the database that are not present in the Data element.
- The partial item inside the Data MUST still satisfy the validity rules defined for the content type specified in Type attribute.
- The item MUST exist on the recipient.

The scope of the meta-information is limited to the command, and MUST match that of any existing object.

**Example 1:** A server sending a field level Replace command to a client.

```xml
<Replace CmdID="901" FieldLevel="true">
  <Meta Type="x-type/x-subtype"/>
  <Item>
    <TargetClientURI>1002</TargetClientURI>
    <Data>
      ...
    </Data>
  </Item>
</Replace>
```

One or more Item element types MUST be specified. The Item element type specifies the data item replaced in the database.

Any TargetClientURI, TargetClientParentURI, SourceClientURI or SourceClientParentURI specified within the Item element type MUST be client LUIDs, as relative to the corresponding TargetServerURI/TargetClientURI or SourceServerURI/SourceClientURI specified in the parent Sync command.

**Example 2:** A client sending a Replace command to a server.

```xml
<Replace CmdID="902">
  <Meta Type="x-type/x-subtype"/>
  <Item>
    <SourceClientURI FP="1234">1002</SourceClientURI>
    <Data>
      ...
    </Data>
  </Item>
</Replace>
```

When synchronizing hierarchical objects, the Replace command from a client MUST include parent information. For this purpose a SourceClientParentURI element MUST be used by the client device referring to an existing parent by LUID. The Replace command from a server MUST NOT include parent information.

In the case where an item has been modified and moved, Replace MUST NOT be used to Move the item.

If the Replace command is used by the client for a hierarchical Add operation, then the client MUST add the parent first before adding any children of that parent. For example, if an item B has a parent A, then before adding item B, parent A MUST be added by the client.

**Example 3:** The client sends a hierarchical replace command to the server.
Status Codes:

If the command completed successfully, then the (200) OK exception condition is created by the command. However, if the command was interpreted as an Add command and the command completed successfully, then the (201) Item added exception condition is created by this command.

If the originator's authentication credentials specify a principal with insufficient rights to complete the command, then the (401) Unauthorized exception condition is created by the command.

If no authentication credentials were specified, then (407) Authentication required exception condition is created by the command. A suitable challenge can also be returned.

Non-specific errors created by the recipient while attempting to complete the command create the (500) Command failed exception condition.

If there is insufficient space on the recipient database for updating the data item, then the (420) Device full exception condition is created by the command, and the originator SHOULD NOT attempt to add additional data until the recipient has more free space.

If the MIME content type or content format for the data item is not supported by the recipient, then the (415) Unsupported media type or format exception condition is created by the command.

In case the recipient is unable to process a partial item update (e.g. when the item does not exist on recipient), it MUST return (426) Partial item not accepted.

Example 4: The following example specifies a server sending a hierarchical Replace command to the client. The TargetClientURI contains the relative URI of the item that was replaced. The absolute URI of the Source is specified in the parent Sync element type (not shown in the example).

```xml
<Replace CmdID="904">
  <Meta Type="..."/>
  <Item>
    <TargetClientURI>1002</TargetClientURI>
    <Data>
      ...
    </Data>
  </Item>
</Replace>
```

6.2.53 RespURI

Usage: Specifies the URI that the recipient MUST use for any response to this message.

Parent Element: SyncHdr

Content Model:

```xml
<xs:element name="RespURI" type="xs:anyURI"/>
```
Restrictions:

The value of this element is the address, in the form of an absolute URI that the recipient MUST use for any response to this message. If the Source is not the same as this value, then the SourceServerURI element MUST also be specified in the SyncHdr element type. Note that the server and databases are the same entities at this new address. The recipient of this command SHOULD NOT resend the previous message.

6.2.54 Results

Usage: Specifies the SyncML command that is used to return the results of a Get command.

Parent Element: SyncBody

Content Model:

```xml
<xs:element name="Results" type="ResultsType"/>
<xs:complexType name="ResultsType">
  <xs:sequence>
    <xs:element ref="Meta" minOccurs="0"/>
    <xs:element ref="Item" maxOccurs="unbounded"/>
  </xs:sequence>
  <xs:attribute ref="CmdID" use="required"/>
  <xs:attribute ref="MsgRef" use="required"/>
  <xs:attribute ref="CmdRef" use="required"/>
</xs:complexType>
```

Restrictions:

The OPTIONAL MsgRef attribute specifies the MsgID of the associated SyncML request. If the MsgRef is not present in a Results element type, then the MsgRef value of "1" MUST be assumed.

The CmdRef attribute specifies the CmdID of the associated SyncML request.

One or more Item element types MUST be specified. The Item element type specifies the results. The SourceClientURI/SourceServerURI specified within the Item element type SHOULD be a relative URI, as relative to the corresponding SourceClientURI/SourceServerURI in the Get command.

Example: The following is an example of Results returned from a Get command.

```xml
<Results CmdID="4321" MsgRef="1" CmdRef="1">
  <Meta Type="text/x-vCard"/>
  <Item>
    <SourceClientURI>./1</SourceClientURI>
    <Data>BEGIN:VCARD
    VERSION:2.1
    FN:Bruce Smith
    N:Smith, Bruce
    TEL;WORK;VOICE:+1-919-555-1234
    END:VCARD
    </Data>
  </Item>
  <Item>
    <SourceClientURI>./2</SourceClientURI>
    <Data>BEGIN:VCARD
    VERSION:2.1
    FN:Ida Blue
    N:Blue, Ida
    TEL;WORK;VOICE:+1-919-555-2345
    END:VCARD
    </Data>
  </Item>
</Results>
```
6.2.55  Sequence

Usage: Specifies the SyncML attribute to order the processing of a set of SyncML commands.

Parent Element: Sync

Content Model:

```xml
<x:s:attribute name="Sequence" type="xs:boolean" default="false"/>
```

Restrictions:

- If the command with Sequence attribute completed successfully, then the (200) OK exception condition is created by the command.
- If the recipient does not support the Sequence attribute, then the (406) Optional feature not supported exception condition is created by the command.
- Non-specific errors created by the recipient while attempting to complete the command with Sequence attribute create the (500) Command failed exception condition.

Example: The following is an incomplete (i.e., Add and Delete commands only include skeleton content) example for a Sequence command containing two Add commands, followed by a Delete command.

```xml
<Sync Sequence="true" CmdID="1234">
  <Add CmdID="1235">
    ...
  </Add>
  <Add CmdID="1236">
    ...
  </Add>
  <Delete CmdID="1237">
    ...
  </Delete>
</Sync>
```

6.2.56  ServerURI

Usage: Specifies the SourceServerURI or TargetServerURI referenced by a Status or Results element type

Parent Elements: StatusItem, Status, Results

Content Model:

```xml
<x:s:element name="ServerURI" type="xs:anyURI"/>
```
Restrictions:

When specified in the Status element type, specifies the Server address specified in the command associated with the response status. When specified in the StatusItem element type, specifies the server address specified in the specific Item. When specified in the Results element type, specifies the Server address specified in the associated Get command.

The element type MUST be specified in a Status command corresponding to any SyncML command that includes the SourceServerURI or TargetServerURI element type.

Example:

```
<Status CmdID="4321" MsgRef="1" CmdRef="1234" Cmd="Add" Code="200">
  <ServerURI>ABC012345_1012</ServerURI>
  <ClientURI>1012</ClientURI>
</Status>
```

6.2.57 SessionID

Usage: Specifies the identifier of the SyncML session associated with the SyncML Message.

Parent Element: SyncHdr

Content Model:

```
<xs:attribute name="SessionID" type="xs:unsignedInt"/>
```

Restrictions:

The value is an opaque string. The element type MUST be specified in the SyncHdr element type in all SyncML Messages. The initiator SHOULD use unique SessionIDs for each session.

The maximum length of a SessionID is 4 bytes. Note for a client having an 8 bit incrementing SessionID counter is enough for practical implementations.

Example:

```
<SyncML ...>
  <SyncHdr SessionID="1" MsgID="3" >
    ...
  </SyncHdr>
  <SyncBody>
    ...blah, blah...
  </SyncBody>
</SyncML>
```

6.2.58 SftDel

Usage: Indicates that the Delete command is a "Soft Delete".

Parent Element: Delete

Content Model:

```
<xs:attribute name="SftDel" type="xs:boolean" default="false"/>
```

Restrictions:

The data item is deleted from the client data store but not from the set of synchronization data. The "Soft Delete" can be specified by an OMA DS server to free up storage resources in the OMA DS client prior to a synchronization operation.
If not present, then the semantics of the delete command are a "Hard Delete" of the data item. In addition, the OMA DS client can specify the "Soft Delete" to free up storage resources in the OMA DS client prior to a synchronization operation with the OMA DS server.

The OMA DS client MUST maintain the LUID (Local Unique Identifier) associated with the soft-deleted item so that server(s) can re-use the LUID if the item is modified by a server.

The OMA DS server MUST NOT delete the map items associated with the "Soft Deleted" items.

If the OMA DS client does not support the "Soft Delete", then, a (406) Optional feature not supported MUST be returned in the Status command.

In a two-way synchronization, if the OMA DS client specifies a "Soft Delete" for an item that has already been "Hard Deleted" on the OMA DS server, then a (423) Soft-delete conflict MUST be returned in the Status command.

Example: The server requests the client to Soft Delete a set of items to free storage on the device. The items are identified by client LUIDs.

```xml
<Delete CmdID="403" SftDel="true">
  <Item><TargetClientURI>1018</TargetClientURI></Item>
  <Item><TargetClientURI>1019</TargetClientURI></Item>
  <Item><TargetClientURI>1020</TargetClientURI></Item>
</Delete>
```

6.2.59 Size

Usage: Specifies the byte size of a data object.

Parent Element: Meta

Content Model:

```xml
<xs:attribute name="Size" type="xs:unsignedLong"/>
```

Restrictions:

The byte size is specified as the numeric text equivalent of the byte count of the data object. In case a Meta element containing a Size attribute contains meta-information about a Data object, this Meta element MUST have the same parent as the Data object it refers to.

Example: The following example illustrates how this attribute is used to specify meta-information about the byte size of the Item element type.

```xml
<Item>
  <TargetClientURI>4</TargetClientURI>
  <Meta Format="chr" Type="text/plain" Size="10" />
  <Data>John Smith</Data>
</Item>
```

6.2.60 SourceClientURI

Usage: Specifies source routing or mapping information by client identifier.

Parent Elements: Item, Sync, SyncHdr

Content Model:

```xml
<x:element name="SourceClientURI" type="URIWithFPType"/>
```
<xs:complexType name="URIWithFPType">
  <xs:simpleContent>
    <xs:extension base="xs:anyURI">
      <xs:attribute ref="FP" use="optional"/>
    </xs:extension>
  </xs:simpleContent>
</xs:complexType>

Restrictions:

When specified in the Item element type, the SourceClientURI element type specifies the client identifier for the item that is the source of the SyncML command.

When specified in the SyncHdr element type, the SourceClientURI element type specifies the source routing information for the client device that originated the SyncML Message. This MUST be specified by the client of the session, and MUST NOT be specified by the server of the session.

If the RespURI element type is also specified within the SyncHdr, then the SourceClientURI element type specifies the source routing information for a proxy originator of the SyncML message.

When specified in the Sync element type, the SourceClientURI element type specifies the source routing information of the client datastore originating the data synchronization request.

Example: The following is an example of the usage in an Item element type sent from the client.

```xml
<Replace CmdID="4567">
  <Item>
    <TargetServerURI>./bruce1/pnab</TargetServerURI>
    <SourceClientURI FP="3456">./contacts</SourceClientURI>
    ... ...
  </Item>
</Replace>
```

6.2.61 SourceClientParentURI

Usage: Specifies the client’s parent information of the current item. This may be in the form of a path or the actual Client unique identifier.

Parent Element: Item

Content Model:

```xml
<xs:element name="SourceClientParentURI" type="xs:anyURI"/>
```

Restrictions:

SourceClientParentURI provides parent information of the child that is the current Item of Sync commands such as Move, Add and Replace. SourceClientParentURI MUST be specified in Add, Replace or Move, if and only if the objects have hierarchical nature, i.e. have a parent and child relation, and the client side ID of the parent is known. SourceClientParentURI has meaning only when synchronizing objects in a datastore with hierarchical structure.

In case the parent container is root then the value of the SourceClientParentURI MUST be indicated by ‘/’, without the quotes.

The SourceClientParentURI element represents the client side’s ID of an item.
6.2.62 SourceServerURI

Usage: Specifies source routing or mapping information by server identifier.

Parent Element: Item, Sync, SyncHdr

Content Model:

```xml
<xs:element name="SourceServerURI" type="xs:anyURI"/>
```

Restrictions:

When specified in the Item element type, the SourceServerURI element type specifies the server database item that is the source of the SyncML command.

When specified in the SyncHdr element type, the SourceServerURI element type specifies the source routing information for the network device that originated the SyncML Message. This MUST be specified by the server of the session, and MUST NOT be specified by the client of the session.

If the RespURI element type is also specified within the SyncHdr, then the SourceServerURI element type specifies the source routing information for a proxy originator of the SyncML message.

When specified in the Sync element type, the SourceServerURI element type specifies the source routing information of the server datastore originating the data synchronization request.

Example: The following is an example of the usage in an Item element type sent from the client.

```xml
<Replace CmdID="4567">
  <Item>
    <TargetServerURI>./brucel/pnab</TargetServerURI>
    <SourceClientURI>./contacts</SourceClientURI>
    ... ...
  </Item>
</Replace>
```

6.2.63 SourceServerParentURI

Usage: Specifies the server’s parent information of the current item. This may be in the form of a path or the actual Server unique identifier.

Parent Element: Item

Content Model:

```xml
<xs:element name="SourceServerParentURI" type="xs:anyURI"/>
```

Restrictions:

SourceServerParentURI provides the server’s parent information of the current Item of the Sync commands such as Move, Add and Replace. SourceServerParentURI MUST be specified in Add, Replace or Move, if and only if the objects have hierarchical nature, i.e. have a parent and child relation, and only the server side ID of the parent is known. SourceServerParentURI has meaning only when synchronizing objects in a datastore with hierarchical structure.

In case the parent container is root then the value of the SourceServerParentURI MUST be indicated by ‘\’ without the quotes.

The SourceServerParentURI element represents a temporary ID (GUID) of the item that was previously sent by the server to the client and for which the mapping was not yet received by the server.
In the case of moving a child on the server that was already synced with the client to a new parent, which hasn’t been synced, the server MUST use `SourceServerParentURI`. In such situations the new parent has to be added before the `Move` can be performed. This scenario is further illustrated by the example.

Example:

```xml
<Add CmdID="12345">
  <Item>
    <SourceServerURI>1002345/</SourceServerURI>
    <Data>
      ...
    </Data>
  </Item>
</Add>

<!-- Since this is an add from the server to the client, client will assign an id on its own to the folder added by the server. The mapping of the client’s id with server TempGUID ‘1002345’ MUST be maintained by the client till the end of Package 4 -->

<Move CmdID="1234">
  <Meta Type="text/plain"/>
  <Item>
    <TargetServerURI>110</TargetServerURI>
    <SourceServerParentURI>1002345</SourceServerParentURI>
  </Item>
</Move>

<!-- Since server hasn’t received the mapping yet, server will use the same TempGUID ‘1002345’ when addressing the NEW Parent folder in the SourceParent of the Move Command -->
```

6.2.64 Status

Usage: Specifies the request status code for a corresponding SyncML command.

Parent Element: SyncBody

Content Model:

```xml
<xs:element name="Status" type="StatusType"/>
<xs:complexType name="StatusType">
  <xs:sequence>
    <xs:element ref="ServerURI" minOccurs="0"/>
    <xs:element ref="ClientURI" minOccurs="0"/>
    <xs:element ref="Anchor" minOccurs="0"/>
    <xs:element ref="Cred" minOccurs="0"/>
    <xs:element ref="Chal" minOccurs="0"/>
    <xs:element ref="StatusItem" minOccurs="0" maxOccurs="unbounded"/>
    <xs:element ref="Item" minOccurs="0"/>
  </xs:sequence>
  <xs:attribute ref="CmdID" use="required"/>
  <xs:attribute ref="MsgRef" use="required"/>
  <xs:attribute ref="CmdRef" use="required"/>
  <xs:attribute ref="Cmd" use="required"/>
  <xs:attribute ref="Code"/>
</xs:complexType>
```

Restrictions:

A Status command only applies to the command corresponding to the specified `CmdRef` (i.e., 1:1 correspondence of a command and a Status).
If there were no Item elements specified in the original command, then the Code of the Status command MUST contain the status code for the original command. In this case, the ServerURI of the Status command MUST contain the contents of the TargetServerURI of the original command, if one was specified. If there was no TargetServerURI specified in the original command, then the ServerURI of the Status command MUST contain the contents of the SourceServerURI of the original command, if one was specified. If neither were specified, the ServerURI MUST be omitted. Additionally, the ClientURI MUST contain the contents of the TargetClientURI of the original command, if one was specified. If there was no TargetClientURI specified in the original command, then the ClientURI of the Status command MUST contain the contents of the SourceClientURI of the original command, if one was specified. If neither were specified, the ClientURI MUST be omitted.

If there were one or more Item elements specified in the original command, and if the Items’ status Codes were not the same (if there was more than one), or a client wishes to specify a new identifier for an item then there MUST be a corresponding StatusItem returned for each of the Items of the original command. If this does not apply, StatusItems MAY be returned for each of the Items of the original command. If any StatusItems are returned, there MUST be a StatusItem for each of the Items of the original command.

If there were one or more Item elements specified in the original command and StatusItems are not included in the Status command, the Code of the Status command MUST contain the status code for all Item of the original command. Additionally, the ServerURI and ClientURI MUST be omitted.

If StatusItems are included in the Status command, a default status Code MAY be set as the Code of the Status command. If no default status is specified, each StatusItem MUST include a status Code. Any status Code specified in a StatusItem overrides any default value. The ServerURI and ClientURI of the Status command MUST be omitted. Additionally, the ServerURI of the StatusItem MUST contain the contents of the TargetServerURI of the original corresponding Item, if a TargetServerURI was specified. If there was no TargetServerURI specified in the corresponding Item, then the ServerURI of the Status command MUST contain the contents of the SourceServerURI of the corresponding Item, if one was specified. If neither were specified, the ServerURI MUST be omitted from that StatusItem. Additionally, the ClientURI of the StatusItem MUST contain the contents of the TargetClientURI of the corresponding Item, if one was specified. If there was no TargetClientURI specified in the corresponding Item, then the ClientURI of the Status command MUST contain the contents of the SourceClientURI of the corresponding Item, if one was specified. If neither were specified, the ClientURI MUST be omitted from the StatusItem.

If the Status command is associated with a command that had other commands inside it (e.g., Sync), then the status value only applies to the corresponding command, and is not related to the status of the commands inside it.

Ordering of Status commands in a SyncML response MUST match the order of the commands in the corresponding SyncML request, except for the Status of the SyncHdr. That is, when there are multiple commands in a SyncML request, then the corresponding Status commands MUST appear in the SyncML response in the same order as the associated commands appeared in the SyncML request. Note that for nested commands, such as an Add command within a Sync command, this means that the Status of the Sync command MUST come before the Status of the Add command.

In addition, the Status on the SyncHdr MUST be the first Status element in the SyncBody of the response. Even in the case where the Statuses for the previous request span multiple messages/responses, the Status on SyncHdr MUST be the first Status element followed by any remaining Statuses from previous messages/responses (maintaining order), followed by any remaining Statuses from the most recent message/response.

The MsgRef attribute specifies the MsgID of the associated SyncML request.

The CmdRef attribute specifies the CmdID of the associated SyncML request. The attribute MUST be present. If "0", the Status command corresponds to a status code for the SyncHdr of the SyncML message referenced by the Status command.

The Cmd attribute specifies the name of the SyncML command associated with the SyncML request. The value of this attribute can also be "SyncHdr" when the CmdRef attribute has a value of "0".
The Chal element type specifies the authentication challenge for the command or the message. If the status code in the Code attribute is (401) Unauthorized or (407) Authentication required, the challenge SHOULD be included. If the status code in the Code attribute is (441) Encrypted symmetry key error or (447) Encryption required, the challenge SHOULD be included.

The OPTIONAL Anchor attribute specifies the sync anchor information.

The Code attribute specifies the request status code type.

The OPTIONAL and repeatable StatusItem element type contains additional information about the status of individual Items of the original command. The StatusItem element may specify changes to the server's item identifier map table. Map tables are used to correlate small resolution item identifiers with larger resolution item identifiers, or between two differing name spaces of identifiers. The client identifier for a given item is known as a LUID. The server identifier for a given item is known as a GUID. For example, if a mobile device has 2-byte item identifiers (LUIDs) and a network server has 16-byte item identifiers (GUIDs), a map table is necessary to correlate an equivalent 2-byte and 16-byte identifier. Generally, map tables are maintained by the data synchronization engine on the network server. Item identifier map tables are not necessary when the originator and the recipient databases are exact replicas of each other (i.e., the databases have the same physical schema).

If an item identifier map table is needed, it is the responsibility of the recipient/server maintaining the map table to perform item identifier translations when communicating synchronization commands with the client that required the map table.

The processing of a Status command that contains StatusItem elements that provide mapping MUST be atomic in nature. This means that the recipient/server MUST process either the entire list of mappings supplied, or none of them. If the operation fails, the recipient/server SHOULD request a recovery sync when appropriate.

This specification permits a Status command to be issued against another Status command. This case will probably not normally be encountered. However, there are extreme cases where this feature is necessary. For example, if a server returns a (401) Unauthorized status code with a request for an authentication scheme that is not supported by the client, the client might use a (406) Optional feature unsupported to notify the server that that requested authentication scheme is not supported and negotiate an authentication scheme it does support. SyncML servers and SyncML clients not supporting such a usage case need provide no further response to the SyncML entity issuing the "Status on a Status".

The OPTIONAL Item element type MAY contain additional information relevant to the original command.

A Status MUST also be returned for the SyncHdr. However, if a client creates a message containing only a successful Status on a SyncHdr, the entire message MUST NOT be sent. A server MUST send this message.

Status codes are listed in Section 10, Response Status Codes.

Example:

```
<SyncBody>
  <Status CmdID="8765" MsgRef="1" CmdRef="1234" Cmd="Add" Code="401">
    <ServerURI></ServerURI>
    <ClientURI>IMEI:001004FF1234567</ClientURI>
  </Status>
</SyncBody>
```

6.2.65 StatusItem

Usage: Specifies the Item receiving a status, as well as an optional ID mapping.

Parent Element: Status

Content Model:

```xml
<x:s:element name="StatusItem" type="StatusItemType"/>
```
Restrictions:

The `ClientURI` element type specifies the relative URI for the client’s item identifier (LUID). This is either an existing identifier, taken from the `SourceClientURI` or `TargetClientURI` of the associated Item, or a new client identifier may be specified by the client if one did not previously exist.

The `ServerURI` element type specifies server’s item identifier (GUID) as a relative URI taken from the `SourceServerURI` or `TargetServerURI` of the associated Item, if one was specified.

Example:

```xml
<StatusItem>
  <ServerURI>ABC012345_100x</ServerURI>
  <ClientURI>100x</ClientURI>
</StatusItem>
```

6.2.66 Sync

Usage: Specifies the SyncML command that indicates a data synchronization operation.

Parent Element: SyncBody

Content Model:

```xml
<xs:element name="Sync" type="SyncCmdType"/>
<xs:complexType name="SyncCmdType">
  <xs:sequence>
    <xs:element ref="Cred" minOccurs="0"/>
    <xs:choice>
      <xs:element ref="TargetClientURI" minOccurs="0"/>
      <xs:element ref="TargetServerURI" minOccurs="0"/>
    </xs:choice>
    <xs:choice>
      <xs:element ref="SourceClientURI" minOccurs="0"/>
      <xs:element ref="SourceServerURI" minOccurs="0"/>
    </xs:choice>
    <xs:element ref="Meta" minOccurs="0" maxOccurs="unbounded">
      <xs:choice minOccurs="0" maxOccurs="unbounded">
        <xs:element ref="Add"/>
        <xs:element ref="Copy"/>
        <xs:element ref="Delete"/>
        <xs:element ref="Move"/>
        <xs:element ref="Replace"/>
      </xs:choice>
    </xs:element>
  </xs:sequence>
  <xs:attribute ref="CmdID" use="required"/>
  <xs:attribute ref="MaxObjSize" use="optional"/>
  <xs:attribute ref="Atomic" use="optional"/>
  <xs:attribute ref="Sequence" use="optional"/>
  <xs:attribute ref="NumberOfChanges" use="optional"/>
  <xs:attribute ref="FreeID" use="optional"/>
  <xs:attribute ref="FreeMem" use="optional"/>
</xs:complexType>
```
Restrictions:

The **TargetClientURI** / **TargetServerURI** element type MUST be used to specify the recipient database to be synchronized.

The **SourceClientURI** / **SourceServerURI** element type MUST be used to specify the originator database to be synchronized.

The optional datastore-specific **FreeID** and **FreeMem** attributes in the **Sync** command MUST be associated with the source datastore specified in the **SourceClientURI** / **SourceServerURI** element of the **Sync** command.

Zero or more **Add**, **Replace**, **Delete**, **Copy** or **Move** element types MUST be specified. There is no implied order to the processing of these commands unless the **Sequence** attribute is set.

If the command completed successfully, then the **(200) OK** exception condition is created by the command.

If the originator's authentication credentials specify a principal with insufficient rights to complete the command, then the **(401) Unauthorized** exception condition is created by the command. If no authentication credentials were specified, then **(407) Authentication required** exception condition is created by the command. A suitable challenge can also be returned.

If the originator's authentication credentials specify a principal that has had its rights to issue **Sync** commands denied, then the **(403) Forbidden** exception condition is created by this command. However, if the recipient does not want to make this fact public, then the **(404) Not found** exception condition can be used.

If the recipient does not allow **Sync** commands either on the specified database or on the network device, then the **(405) Command not allowed** exception condition is created by this command.

If the specified database cannot be found on the recipient network device, then the **(404) Not found** exception condition is created by this command.

If the recipient determines that there is a high probability that the client device data is out of sync, then the **(508) Refresh required** exception condition is created by this command. When this exception condition occurs, the originator of the **Sync** command SHOULD initiate a slow synchronization with the recipient.

Non-specific errors created by the recipient while attempting to complete the command create the **(500) Command failed** exception condition.

Example: The following is an example of a **Sync** command with authentication credentials and a single **Add** of a calendar entry.

```
<Sync CmdID="1234">
  <Cred>
    <Meta Type="syncml:auth-md5" Format="b64"/>
    <Data>Zz6EivR3yeaaENcRN6lpAQ==</Data>
  </Cred>
  <TargetServerURI>./mail/bruce1</TargetServerURI>
  <SourceClientURI>./calendar</SourceClientURI>
  <Add CmdID="1246">
    <Item>
      <SourceClientURI>./12</SourceClientURI>
      <Meta Type="text/x-vCalendar"/>
      <Data>BEGIN:VCALENDAR
          VERSION:1.0
          BEGIN:VEVENT
          DTSTART:20000531T160000Z
          DTEND:20000531T160100Z
          SUMMARY:Release v0.9 of specs
          END:VEVENT
      </Data>
    </Item>
  </Add>
</Sync>
```
6.2.67 SyncAlert

**Usage:** Specifies the parameters for the sync type negotiation. Both the data sync client and server can use this element to alert the other side to initiate a specific data synchronization session.

**Parent Element:** SyncBody

**Content Model:**

```xml
<xs:element name="SyncAlert" type="SyncAlertType"/>
<xs:complexType name="SyncAlertType">
  <xs:sequence>
    <xs:element ref="Anchor"/>
    <xs:element ref="Cred" minOccurs="0"/>
    <xs:choice>
      <xs:element ref="TargetClientURI"/>
      <xs:element ref="TargetServerURI"/>
    </xs:choice>
    <xs:choice>
      <xs:element ref="SourceClientURI"/>
      <xs:element ref="SourceServerURI"/>
    </xs:choice>
    <xs:element ref="SyncType"/>
    <xs:element ref="IDContainer" minOccurs="0"/>
    <xs:element ref="Filter" minOccurs="0"/>
  </xs:sequence>
  <xs:attribute ref="CmdID" use="required"/>
  <xs:attribute ref="MaxObjSize" use="optional"/>
  <xs:attribute ref="Correlator" use="optional"/>
  <xs:attribute ref="NoStatus" use="optional"/>
</xs:complexType>
```

**Restrictions:**

The `SyncType` element specifies the parameters for the sync type negotiation.

The `IDValidity` attribute specifies if the ID is valid.

The semantics of `Direction`, `Behaviour`, `IDValidity` and `ChangeLogValidity` are described in [DSPRO].

The `TargetClientURI`/`TargetServerURI` and `SourceClientURI`/`SourceServerURI` elements specify the target and source address to be synchronized. The semantics of `TargetClientURI`/`TargetServerURI` and `SourceClientURI`/`SourceServerURI` are described in [DSPRO].

The optional `Filter` element specifies the filter criteria.

The optional `IDContainer` element specifies one or more data item identifiers.

The `Last` and `Next` attributes of the `Anchor` element specify the synchronization state information for the last and current session, respectively.

If multiple target and source addresses need to be synchronized within one session, the Data Sync Client or Server MUST use the `SyncAlert` command for each target and source pair to negotiate the sync types.
If the command and the associated action are completed successfully, then the status code ‘(200) OK’ is created by the command.

Example: The following is an example for a data sync client to initiate a normal sync from client to server only.

```xml
<SyncAlert CmdID="1">
  <Anchor Last="234" Next="276"/>
  <Cred>
    <Meta Type="syncml:auth-sha256" Format="b64"/>
    <Data>...</Data>
  </Cred>
  <TargetServerURI>/Macy/02</TargetServerURI>
  <SourceClientURI>/Macy/02</SourceClientURI>
  <SyncType Direction="fromClient" Behaviour="Preserve" IDValidity="true"
    ChangeLogValidity="true"/>
</SyncAlert>
```

6.2.68 SyncBody

Usage: Specifies the container for the body or contents of the SyncML message.

Parent Element: SyncML

Content Model:

```xml
<xs:element name="SyncBody" type="SyncBodyType"/>
<xs:complexType name="SyncBodyType">
  <xs:sequence>
    <xs:choice maxOccurs="unbounded">
      <xs:element ref="Add"/>
      <xs:element ref="Alert"/>
      <xs:element ref="Copy"/>
      <xs:element ref="Delete"/>
      <xs:element ref="Get"/>
      <xs:element ref="Move"/>
      <xs:element ref="Put"/>
      <xs:element ref="Replace"/>
      <xs:element ref="Results"/>
      <xs:element ref="Status"/>
      <xs:element ref="Sync"/>
      <xs:element ref="SyncAlert"/>
    </xs:choice>
    <xs:element ref="Final" minOccurs="0" minOccurs="0"/>
  </xs:sequence>
</xs:complexType>
```

Restrictions:

None.

Example:

```xml
<SyncML xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="OMA-SUP-XSD_DS_Syntax_Schema-V2_0.xsd"
  Version="2.0" >
  <SyncHdr SessionID="1" MsgID="1">
    <TargetClientURI>IMEI:001004FF1234567</TargetClientURI>
    <SourceServerURI>http://www.datasync.org/servlet/syncit</SourceServerURI>
    <Cred AuthName="Bruce">
      <Meta Type="syncml:auth-md5" Format="b64"/>
    </Cred>
  </SyncHdr>
</SyncML>
```
6.2.69  SyncHdr

Usage: Specifies the container for the provisioning, routing information in the SyncML message.

Parent Element: SyncML

Content Model:

```xml
<Data>Zz6EivR3yeaaENcRN6lpAQ==</Data>
</SyncHdr>
<SyncBody>
<Get CmdID="1234">
<Item>
  <TargetClientURI>./devinf20</TargetClientURI>
</Item>
</Get>
</SyncBody>
</SyncML>
```

Restrictions:

The OPTIONAL MaxMsgSize attribute is used to convey the maximum byte size of a SyncML response.

Example:

```xml
<SyncML xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="OMA-SUP-XSD_DS_Syntax_Schema-V2_0.xsd"
   Version="2.0" >
   <SyncHdr SessionID="1" MsgID="1">
     <TargetServerURI>http://www.datasync.org/servlet/syncit</TargetServerURI>
     <SourceClientURI>IMEI:001004FF1234567</SourceClientURI>
   </SyncHdr>
   <SyncBody>
     ...blah, blah...
   </SyncBody>
</SyncML>
```
6.2.70  SyncML

Usage: Specifies the container for a SyncML Message.

Parent Elements: None. This is the root or document element.

Content Model:

```xml
<xs:element name="SyncML">
  <xs:annotation>
    <xs:documentation>Root</xs:documentation>
  </xs:annotation>
  <xs:complexType>
    <xs:sequence>
      <xs:element ref="SyncHdr"/>
      <xs:element ref="SyncBody"/>
    </xs:sequence>
    <xs:attribute ref="Version" use="required"/>
  </xs:complexType>
</xs:element>
```

Restrictions:

Within transports that support MIME content-type identification, this object MUST be identified as application/vnd.syncml+xml (for clear-text, XML representation) or application/vnd.syncml+wbxml (for binary, WBXML representation).

Example:

```xml
<SyncML xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:noNamespaceSchemaLocation="OMA-SUP-XSD_DS_Syntax_Schema-V2_0.xsd"
 Version="2.0" >
  <SyncHdr SessionID="1" MsgID="1">
    ...
  </SyncHdr>
  <SyncBody>
    ...blah, blah...
  </SyncBody>
</SyncML>
```

6.2.71  SyncType

Usage: Specifies the parameters for the sync type negotiation.

Parent Element: SyncAlert

Content Model:

```xml
<xs:element name="SyncType" type="SyncTypeType"/>
<xs:complexType name="SyncTypeType">
  <xs:attribute ref="Direction" use="required" />  
  <xs:attribute ref="Behaviour" use="required" />
  <xs:attribute ref="IDValidity" use="optional" default="true"/>
</xs:complexType>
```
<xs:attribute ref="ChangeLogValidity" use="optional" default="true"/>
</xs:complexType>

Restrictions:

The SyncType element specifies the parameters for the sync type negotiation.

### 6.2.72 TargetClientURI

**Usage:** Specifies target routing or mapping information by client identifier.

**Parent Elements:** Item, Sync, SyncHdr

**Content Model:**

```
<xs:element name="TargetClientURI" type="xs:anyURI"/>
```

**Restrictions:**

When specified in the Item element type, the TargetClientURI element type specifies the server identifier for the item that is the target of the SyncML command.

When specified in the SyncHdr element type, the TargetClientURI element type specifies the target routing information for the client device that is receiving the SyncML Message. This MUST be specified by the server of the session, and MUST NOT be specified by the client of the session.

When specified in the Sync element type, the TargetClientURI element type specifies the source routing information of the database receiving the data synchronization request.

### 6.2.73 TargetClientParentURI

**Usage** Specifies the client’s parent information of the current Item. This may be in the form of a path or the actual Client unique identifier.

**Parent Element:** Item

**Content Model:**

```
<xs:element name="TargetClientParentURI" type="xs:anyURI"/>
```

**Restrictions:**

TargetClientParentURI provides parent information of the child that is the current Item of Sync commands such as Add, Move and Replace. TargetClientParentURI MUST be specified in Add, Replace and Move, if and only if the objects have hierarchical nature, i.e. have a parent and child relation, and the client side ID of the parent is known. TargetClientParentURI has meaning only when synchronizing objects with hierarchical structure.

In case the parent container is a root then the value of the TargetClientParentURI MUST be indicated by ‘/’, without the quotes.

TargetClientParentURI element always represents a LUID, i.e. the ID of client that was previously sent by the client in a StatusItem element. TargetClientParentURI MUST be sent only by servers.

**Example:** the server requests the client to move the item having the LUID ‘110’.

```
<Move CmdID="1234" >
  <Cred>
    <Meta Type="syncml:auth-md5" Format="b64"/>
  </Cred>
</Move>
```
6.2.74 TargetServerURI

Usage: Specifies target routing or mapping information by server identifier.

Parent Elements: Item, Sync, SyncHdr

Content Model:

```xml
<Data>Zz6EivR3yeaaENcRN6lpAQ==</Data>
</Cred>
<Meta Type="text/plain"/>
<Item>
  <TargetClientURI>110</TargetClientURI>
  <TargetClientParentURI>1234</TargetClientParentURI>
</Item>
</Move>
```

Restrictions:

When specified in the Item element type, the TargetServerURI element type specifies the server database item that is the target of the SyncML command.

When specified in the SyncHdr element type, the TargetServerURI element type specifies the target routing information for the network device that receives the SyncML Message. This MUST be specified by the client of the session, and MUST NOT be specified by the server of the session.

When specified in the Sync element type, the TargetServerURI element type specifies the source routing information of the server database receiving the data synchronization request.

6.2.75 TargetServerParentURI

Usage: Specifies the parent information of the current Item. This may be in the form of a path or the actual Server unique identifier.

Parent Element: Item

Content Model:

```xml
<Data>Zz6EivR3yeaaENcRN6lpAQ==</Data>
</Cred>
<Meta Type="text/plain"/>
<Item>
  <TargetClientURI>110</TargetClientURI>
  <TargetClientParentURI>1234</TargetClientParentURI>
</Item>
</Move>
```

Restrictions:

TargetServerParentURI provides parent information of the current Item of Sync commands such as Add, Move and Replace. TargetServerParentURI MUST be specified in Add, Replace and Move, if and only if the objects have hierarchical nature, i.e. have a parent and child relation, and the client identifier is not known. TargetServerParentURI has meaning only when synchronizing objects with hierarchical structure.

In case the parent container is a root then the value of the TargetServerParentURI MUST be indicated by '/', without the quotes.

TargetServerParentURI element always represents a GUID. TargetServerParentURI MUST be sent only by servers.

Example: the server requests the client to move the item having the LUID ‘110’.
6.2.76 Type

Usage: Specifies the media type of the content information in the Data element.

Parent Element: Meta

Restrictions:

If this attribute is missing, then the default content-type is text/plain. The content information for this attribute SHOULD BE a registered MIME content-type. Alternatively, a URN can be used to specify the media type. In case a Meta element containing a Type attribute contains meta-information about a Data object, this Meta element MUST have the same parent as the Data object it refers to.

Content Model:

```xml
<xs:attribute name="Type" type="xs:string"/>
```

Example: The following example illustrates how this attribute is used within a SyncML message to specify meta-information about the media type of the content information in the Item element type.

```xml
<Item>
  <TargetClientURI>3</TargetClientURI>
  <Meta Format="chr" Type="text/directory;profile=vCard"/>
  <Data>BEGIN:VCARD
  VERSION:3.0
  FN:Jim Smith
  N:Smith;Jim
  TEL;TYPE=WORK,VOICE,FAX:+1-919-555-1234
  EMAIL;TYPE=INTERNET,WORK:Jim_Smith@mail.host.com
  END:VCARD
  </Data>
</Item>
```

6.2.77 Version

Usage: Specifies the major and minor version identifier of the DS Syntax protocol specification used to represent the SyncML message.

Parent Element: SyncML

Content Model:

```xml
<xs:attribute name="Version" type="xs:string"/>
```

Restrictions:
Each SyncML Message in each SyncML Package sent from an originator to a recipient MUST include the Version attribute in the SyncHdr.

Major revisions of the specification create incompatible changes that will generally require a new SyncML parser. Minor revisions involve changes that do not impact basic compatibility of the parser. When the XML document conforms to this revision of the OMA DS Syntax specification the value MUST be 2.0.

Example:

```xml
<SyncML xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
         xsi:noNamespaceSchemaLocation="OMA-SUP-XSD_DS_Syntax_Syntax_Schema-V2_0.xsd"
         Version="2.0">
  <SyncHdr SessionID="1" MsgID="1">
    ...
  </SyncHdr>
  <SyncBody>
    ...
  </SyncBody>
</SyncML>
```
7. XML Schema

Please refer to the Syntax Schema specification.
8. WBXML Definition

The following tables define the token assignments for the mapping of the SyncML related Schemas and element types into WBXML as defined by [WBXML].

8.1 Code Space Definitions

This version of the SyncML representation protocol specification maps all the SyncML related Schemas into WBXML code spaces.

<table>
<thead>
<tr>
<th>DTD Name</th>
<th>WBXML PUBLICID Token (Hex Value)</th>
<th>Formal Public Identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>SyncML</td>
<td>FD1</td>
<td>-//SYNCML/DTD SyncML 1.0//EN</td>
</tr>
<tr>
<td>SyncML 1.1</td>
<td>FD3</td>
<td>-//SYNCML/DTD SyncML 1.1//EN</td>
</tr>
<tr>
<td>SyncML 1.2</td>
<td>0x1201</td>
<td>-//SYNCML/DTD SyncML 1.2//EN</td>
</tr>
<tr>
<td>SyncML 2.0</td>
<td>0x1205</td>
<td>-//SYNCML/Schema SyncML 2.0//EN</td>
</tr>
</tbody>
</table>

Table 10: Code Space Definitions

The SyncML Schema is assigned the WBXML document public identifier (i.e., the "publicid" WBXML BNF production) associated with the 0x1205 token.

8.2 Code Page Definitions

The following code page tokens represent SyncML related public identifiers. This version of the SyncML representation protocol specification utilizes the WBXML code page tokens for identifying schema.

<table>
<thead>
<tr>
<th>DTD Name</th>
<th>WBXML Code Page Token (Hex Value)</th>
<th>Formal Public Identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>SyncML</td>
<td>00</td>
<td>-//SYNCML/Schema SyncML 2.0//EN</td>
</tr>
</tbody>
</table>

Table 11: Code Page Definitions
### 8.3 Element Token Definitions

The following WBXML token codes represent element types (i.e., tags) from code page x00 (zero), SyncML Schema.

<table>
<thead>
<tr>
<th>Element Type Name</th>
<th>WBXML Tag Token (Hex Value)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>05</td>
</tr>
<tr>
<td>Alert</td>
<td>06</td>

<tr>
<td>LDAP</td>
<td>Lightweight Directory Access Protocol</td>
</tr>
<tr>
<td>OBEX</td>
<td>IrDA Object Exchange Protocol</td>
</tr>
<tr>
<td>SYNCML</td>
<td>SyncML specific, as defined in one of the protocol or format specifications</td>
</tr>
<tr>
<td>WSP</td>
<td>Wireless Session Protocol</td>
</tr>
<tr>
<td>ESN</td>
<td>Electronic Serial Number</td>
</tr>
<tr>
<td>MEID</td>
<td>Mobile Equipment Identity</td>
</tr>
</tbody>
</table>

Table 16: Common URI Scheme Types
10. Alert Types

The alert types in SyncML are a numeric text value. The types are divided into two classes, User Alert, that are intended to be conveyed to the recipient's user agent, and Application Alert, that are intended to be conveyed to a target application on the recipient. The only valid values are the standard values defined in this specification.

Implementations that desire to add to these values SHOULD submit a change request to technical-comments@openmobilealliance.org

<table>
<thead>
<tr>
<th>Alert Code Value</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>DISPLAY</td>
<td>Show. The Data element type contains content information that SHOULD be processed and displayed through the user agent.</td>
</tr>
<tr>
<td>101-150</td>
<td>-</td>
<td>Reserved for future SyncML usage.</td>
</tr>
<tr>
<td>211</td>
<td>END SESSION</td>
<td>Specifies a request to end the session.</td>
</tr>
<tr>
<td>212</td>
<td>ALERT POLL</td>
<td>Specifies a request to poll.</td>
</tr>
<tr>
<td>213</td>
<td>ALERT IDLE</td>
<td>Specifies a request to idle.</td>
</tr>
<tr>
<td>214-220</td>
<td>-</td>
<td>Reserved for future SyncML usage.</td>
</tr>
<tr>
<td>221</td>
<td>RESULT ALERT</td>
<td>Specifies a request for synchronization results.</td>
</tr>
<tr>
<td>222</td>
<td>NEXT MESSAGE</td>
<td>Specifies a request for the next message in the package.</td>
</tr>
<tr>
<td>223</td>
<td>NO END OF DATA</td>
<td>End of Data for chunked object not received.</td>
</tr>
<tr>
<td>224-250</td>
<td>-</td>
<td>Reserved for future SyncML usage.</td>
</tr>
</tbody>
</table>

Table 17: Alert Types
11. Response Status Codes

The response status codes in SyncML are a numeric text value. The codes are divided into five classes. The only valid values are the standard values defined in this specification.

Implementations that desire to add to these values SHOULD submit a change request to mailto:technical-comments@openmobilealliance.org.

<table>
<thead>
<tr>
<th>Status Codes</th>
<th>Reason Phrase</th>
</tr>
</thead>
<tbody>
<tr>
<td>Informational 1xx</td>
<td></td>
</tr>
<tr>
<td>101</td>
<td>In progress. The specified SyncML command is being carried out, but has not yet completed.</td>
</tr>
<tr>
<td>Successful 2xx</td>
<td></td>
</tr>
<tr>
<td>200</td>
<td>OK. The SyncML command completed successfully.</td>
</tr>
<tr>
<td>201</td>
<td>Item added. The requested item was added.</td>
</tr>
<tr>
<td>202</td>
<td>Accepted for processing. The request to alert a user or application was successfully performed.</td>
</tr>
<tr>
<td>203</td>
<td>Non-authoritative response. The request is being responded to by an entity other than the one targeted. The response is only to be returned when the request would have resulted in a 200 response code from the authoritative target.</td>
</tr>
<tr>
<td>204</td>
<td>No content. The request was successfully completed but no data is being returned. The response code is also returned in response to a Get when the target has no content.</td>
</tr>
<tr>
<td>205</td>
<td>Reset content. The source SHOULD update their content. The originator of the request is being told that their content SHOULD be synchronized to get an up to date version.</td>
</tr>
<tr>
<td>206</td>
<td>Partial content. The response indicates that only part of the command was completed. If the remainder of the command can be completed later, then when completed another appropriate completion request status code SHOULD be created.</td>
</tr>
<tr>
<td>207</td>
<td>Conflict resolved with merge. The response indicates that the request created a conflict; which was resolved with a merge of the client and server instances of the data. The response includes both the target and source URLs in the Item of the Status. In addition, a Replace command is returned with the merged data.</td>
</tr>
<tr>
<td>208</td>
<td>Conflict resolved with client’s command “winning”. The response indicates that there was an update conflict; which was resolved by the client command winning.</td>
</tr>
<tr>
<td>209</td>
<td>Conflict resolved with duplicate. The response indicates that the request created an update conflict; which was resolved with a duplication of the client’s data being created in the server database. The response includes both the target URI of the duplicate in the Item of the Status. In addition, in the case of a two-way synchronization, an Add command is returned with the duplicate data definition.</td>
</tr>
<tr>
<td>210</td>
<td>Reserved for future SyncML usage.</td>
</tr>
<tr>
<td>211</td>
<td>Item not deleted. The requested item was not found. It could have been previously deleted.</td>
</tr>
<tr>
<td>212</td>
<td>Authentication accepted. No further authentication is needed for the remainder of the synchronization session. This response code can only be used in response to a request in which the credentials were provided.</td>
</tr>
<tr>
<td>213</td>
<td>Chunked item accepted and buffered.</td>
</tr>
<tr>
<td>214</td>
<td>Operation cancelled. The SyncML command completed successfully, but no more commands will be processed within the session.</td>
</tr>
<tr>
<td>215</td>
<td>Not executed. A command was not executed, as a result of user interaction and user chose not to accept the choice.</td>
</tr>
<tr>
<td>216</td>
<td>Atomic roll back OK. A command was inside Atomic element and Atomic failed. This command was rolled back successfully.</td>
</tr>
<tr>
<td>Redirection 3xx</td>
<td></td>
</tr>
<tr>
<td>300</td>
<td>Multiple choices. The requested target is one of a number of multiple alternatives requested target. The alternative SHOULD also be in the Item element type in the Status.</td>
</tr>
<tr>
<td>301</td>
<td>Moved permanently. The requested target has a new URI. The new URI SHOULD also be returned in the Item element type in the Status.</td>
</tr>
<tr>
<td>302</td>
<td>Found. The requested target has temporarily moved to a different URI. The original URI SHOULD continue to be used. The URI of the temporary location SHOULD also be returned in the Item element type in the Status. The requestor SHOULD confirm the identity and authority of the temporary URI to act on behalf of the original target URI.</td>
</tr>
<tr>
<td>303</td>
<td>See other. The requested target can be found at another URI. The other URI SHOULD be returned in the Item element type in the Status.</td>
</tr>
<tr>
<td>304</td>
<td>Not modified. The requested SyncML command was not executed on the target. This is an additional response that can be added to any of the other Redirection response codes.</td>
</tr>
<tr>
<td>305</td>
<td>Use proxy. The requested target MUST be accessed through the specified proxy URI. The proxy URI SHOULD also be returned in the Item element type in the Status.</td>
</tr>
</tbody>
</table>

Originator Exceptions 4xx
<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400</td>
<td>Bad request. The requested command could not be performed because of malformed syntax in the command. The malformed command MAY also be returned in the Item element type in the Status.</td>
</tr>
<tr>
<td>401</td>
<td>Invalid credentials. The requested command failed because the requestor MUST provide proper authentication. If the property type of authentication was presented in the original request, then the response code indicates that the requested command has been refused for those credentials.</td>
</tr>
<tr>
<td>402</td>
<td>Payment needed. The requested command failed because proper payment is needed. This version of SyncML does not standardize the payment mechanism.</td>
</tr>
<tr>
<td>403</td>
<td>Forbidden. The requested command failed, but the recipient understood the requested command. Authentication will not help and the request SHOULD NOT be repeated. If the recipient wishes to make public why the request was denied, then a description MAY be specified in the Item element type in the Status. If the recipient does not wish to make public why the request was denied then the response code 404 MAY be used instead.</td>
</tr>
<tr>
<td>404</td>
<td>Not found. The requested target was not found. No indication is given as to whether this is a temporary or permanent condition. The response code 410 SHOULD be used when the condition is permanent and the recipient wishes to make this fact public. This response code is also used when the recipient does not want to make public the reason for why a requested command is not allowed or when no other response code is appropriate.</td>
</tr>
<tr>
<td>405</td>
<td>Command not allowed. The requested command is not allowed on the target. The recipient SHOULD return the allowed command for the target in the Item element type in the Status.</td>
</tr>
<tr>
<td>406</td>
<td>Optional feature not supported. The requested command failed because an OPTIONAL feature in the request was not supported. The unsupported feature SHOULD be specified by the Item element type in the Status.</td>
</tr>
<tr>
<td>407</td>
<td>Missing credentials. This response code is similar to 401 except that the response code indicates that the originator MUST first authenticate with the recipient. The recipient SHOULD also return the suitable challenge in the Chal element type in the Status.</td>
</tr>
<tr>
<td>408</td>
<td>Request timeout. An expected message was not received within the REQUIRED period of time. The request can be repeated at another time. The RespUR1 can be used to specify the URI and optionally the date/time after which the requestor can repeat the request. See RespUR1 for details.</td>
</tr>
<tr>
<td>409</td>
<td>Conflict. The request failed because of an update conflict between the client and server versions of the data. Setting of the conflict resolution policy is outside the scope of this version of SyncML. However, identification of conflict resolution performed, if any, is within the scope.</td>
</tr>
<tr>
<td>410</td>
<td>Gone. The requested target is no longer on the recipient and no forwarding URI is known.</td>
</tr>
<tr>
<td>411</td>
<td>Size REQUIRED. The requested command MUST be accompanied by byte size or length information in the Meta element type.</td>
</tr>
<tr>
<td>412</td>
<td>Incomplete command. The requested command failed on the recipient because it was incomplete or incorrectly formed. The recipient SHOULD specify the portion of the command that was incomplete or incorrect in the Item element type in the Status.</td>
</tr>
<tr>
<td>413</td>
<td>Request entity too large. The recipient is refusing to perform the requested command because the requested item is larger than the recipient is able or willing to process. If the condition is temporary, the recipient SHOULD also include a Status with the response code 418 and specify a RespUR1 with the response URI and optionally the date/time that the command SHOULD be repeated.</td>
</tr>
<tr>
<td>414</td>
<td>URI too long. The requested command failed because the target URI is too long for what the recipient is able or willing to process. This response code is seldom encountered, but is used when a recipient perceives that an intruder might be attempting to exploit security holes or other defects in order to threaten the recipient.</td>
</tr>
<tr>
<td>415</td>
<td>Unsupported media type or format. The unsupported content type or format SHOULD also be identified in the Item element type in the Status.</td>
</tr>
<tr>
<td>416</td>
<td>Requested size too big. The request failed because the specified byte size in the request was too big.</td>
</tr>
<tr>
<td>417</td>
<td>Retry later. The request failed at this time and the originator SHOULD retry the request later. The recipient SHOULD specify a RespUR1 with the response URI and the date/time that the command SHOULD be repeated.</td>
</tr>
<tr>
<td>418</td>
<td>Already exists. The requested Put or Add command failed because the target already exists.</td>
</tr>
<tr>
<td>419</td>
<td>Conflict resolved with server data. The response indicates that the client request created a conflict, which was resolved by the server command winning. The normal information in the Status SHOULD be sufficient for the client to &quot;undo&quot; the resolution, if it is desired.</td>
</tr>
<tr>
<td>420</td>
<td>Device full. The response indicates that the recipient has no more storage space for the remaining synchronization data. The response includes the remaining number of data that could not be returned to the originator in the Item of the Status.</td>
</tr>
<tr>
<td>421</td>
<td>Unknown filtering grammar. The requested command failed on the server because the specified filtering grammar was not known. The client SHOULD re-specify the filtering using a known filtering grammar.</td>
</tr>
<tr>
<td>422</td>
<td>Bad CGI Script. The requested command failed on the server because the CGI scripting was incorrectly formed. The client SHOULD re-specify the portion of the command that was incorrect in the Item element type in the Status.</td>
</tr>
<tr>
<td>423</td>
<td>Soft-delete conflict. The requested command failed because the &quot;Soft Deleted&quot; item was previously &quot;Hard Deleted&quot; on the server.</td>
</tr>
<tr>
<td>424</td>
<td>Size mismatch. The chunked object was received, but the size of the received object did not match the size declared within the first chunk.</td>
</tr>
<tr>
<td>Code</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>425</td>
<td>Permission Denied. The requested command failed because the sender does not have adequate access control permissions (ACL) on the recipient.</td>
</tr>
<tr>
<td>426</td>
<td>Partial item not accepted. Receiver of status code MAY resend the whole item in next package.</td>
</tr>
<tr>
<td>427</td>
<td>Item Not empty. Parent cannot be deleted since it contains children.</td>
</tr>
<tr>
<td>428</td>
<td>Move Failed</td>
</tr>
<tr>
<td>429</td>
<td>Key Exchange Algorithm not supported. The requested command failed because the recipient does not support the Key Exchange Algorithm. The recipient should return the suitable challenge in the Chal element within the Status element.</td>
</tr>
<tr>
<td>430</td>
<td>Data Encryption Algorithm not supported. The requested command failed because the recipient does not support the Data Encryption Algorithm. The recipient should return the suitable challenge in the Chal element within the Status element.</td>
</tr>
<tr>
<td>431</td>
<td>Key Length not supported. The requested command failed because the recipient does not support the Symmetric Key Length. The recipient should return the suitable challenge in the Chal element within the Status element.</td>
</tr>
<tr>
<td>432</td>
<td>Encryption required. The requested command failed because the recipient requires encryption.</td>
</tr>
<tr>
<td>500</td>
<td>Command failed. The recipient encountered an unexpected condition which prevented it from fulfilling the request.</td>
</tr>
<tr>
<td>501</td>
<td>Command not implemented. The recipient does not support the command REQUIRED to fulfill the request. This is the appropriate response when the recipient does not recognize the requested command and is not capable of supporting it for any resource.</td>
</tr>
<tr>
<td>502</td>
<td>Bad gateway. The recipient, while acting as a gateway or proxy, received an invalid response from the upstream recipient it accessed in attempting to fulfill the request.</td>
</tr>
<tr>
<td>503</td>
<td>Service unavailable. The recipient is currently unable to handle the request due to a temporary overloading or maintenance of the recipient. The implication is that this is a temporary condition; which will be alleviated after some delay. The recipient SHOULD specify the URI and date/time after which the originator SHOULD retry in the RespURI in the response.</td>
</tr>
<tr>
<td>504</td>
<td>Gateway timeout. The recipient, while acting as a gateway or proxy, did not receive a timely response from the upstream recipient specified by the URI (e.g. HTTP, FTP, LDAP) or some other auxiliary recipient (e.g. DNS) it needed to access in attempting to complete the request.</td>
</tr>
<tr>
<td>505</td>
<td>DTD Version not supported. The recipient does not support or refuses to support the specified version of SyncML DTD used in the request SyncML Message. The recipient MUST include the versions it does support in the Item element type in the Status.</td>
</tr>
<tr>
<td>506</td>
<td>Processing error. An application error occurred while processing the request. The originator SHOULD retry the request. The RespURI can contain the URI and date/time after which the originator can retry the request.</td>
</tr>
<tr>
<td>507</td>
<td>Atomic failed. The error caused all SyncML commands within an Atomic element type to fail.</td>
</tr>
<tr>
<td>508</td>
<td>Recovery REQUIRED. An error occurred that necessitates a refresh of the current synchronization state of the client with the server. Client is requested to initiate a recovery sync with the server.</td>
</tr>
<tr>
<td>509</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>510</td>
<td>Data store failure. An error occurred while processing the request. The error is related to a failure in the recipient data store.</td>
</tr>
<tr>
<td>511</td>
<td>Server failure. A severe error occurred in the server while processing the request. The originator SHOULD NOT retry the request.</td>
</tr>
<tr>
<td>512</td>
<td>Synchronization failed. An application error occurred during the synchronization session. The originator SHOULD restart the synchronization session from the beginning.</td>
</tr>
<tr>
<td>513</td>
<td>Protocol Version not supported. The recipient does not support or refuses to support the specified version of the SyncML Synchronization Protocol used in the request SyncML Message. The recipient MUST include the versions it does support in the Item element type in the Status.</td>
</tr>
<tr>
<td>514</td>
<td>Operation cancelled. The SyncML command was not completed successfully, since the operation was already cancelled before processing the command. The originator SHOULD repeat the command in the next session.</td>
</tr>
<tr>
<td>516</td>
<td>Atomic rollback failed. Command was inside Atomic element and Atomic failed. This command was not rolled back successfully. Server SHOULD take action to try to recover client back into original state.</td>
</tr>
<tr>
<td>518</td>
<td>Refuse to continue the session. The requested command failed because the recipient refuses to continue the session.</td>
</tr>
</tbody>
</table>

Table 19: Base Media and Content formats
13. MIME Media Type Registration

The following section is the MIME media type registrations for OMA Data Synchronization specific MIME media types.

13.1 application/vnd.syncml+xml

To: ietf-types@iana.org

Subject: Registration of MIME media type application/vnd.syncml+xml

MIME media type name: application

MIME subtype name: vnd.syncml+xml

REQUIRED parameters: None

OPTIONAL parameters: charset, synctype, verproto, verdtd. May be specified in any order in the Content-Type MIME header field.

Content-Type MIME header.

charset Parameter

Purpose: Specifies the character set used to represent the SyncML document. The default character set for SyncML representation protocol is UTF-8, as defined in [RFC2279].

Formal Specification: The following ABNF defines the syntax for the parameter.

chrset-param = ";" "charset" "=" <any IANA registered charset identifier>

synctype Parameter

Purpose: Specifies the data synchronization protocol used by the SyncML document. If present, the value MUST be the same value as that specified by the "SyncType" element type in the SyncML MIME content information. There is no default value.

Formal Specification: The following ABNF defines the syntax for the parameter.

stype-param = ";" "synctype" "=" text

verproto Parameter

Purpose: Specifies the major/minor revision identifiers for the SyncML synchronization protocol specification for the workflow of messages with SyncML MIME content. If present, MUST be the same value as that specified by the "VerProto" element type in the SyncML MIME content information. If not present, the default value "1.2" is to be assumed.

Formal Specification: The following ABNF defines the syntax for the parameter.

verprot-param = ";" "verproto" "=" 1*numeric "." 1*numeric

text = 1*ALPHA
verdtd Parameter

Purpose: Specifies the major/minor revision identifiers for the SyncML representation protocol specification that defines the SyncML MIME media type. If present, MUST be the same value as that specified by the "VerDTD" element type in the SyncML MIME content information. If not present, the default value "1.2" is to be assumed.

Formal Specification: The following ABNF defines the syntax for the parameter.

verdtd-param = ";" "verdtd" "=" 1*numeric \." 1*numeric

text = 1*ALPHA

numeric = "0" / "1" / "2" / "3" / "4" / "5" / "6" / "7" / "8"/ "9"

Encoding considerations: The default character set for the SyncML MIME content type is UTF-8. Transfer of this character set through some MIME systems could require that the content is first character encoded into a 7bit character set with an IETF character encoding mechanism such as Base64, as defined in [RFC2045]

Security considerations:

Authentication: The SyncML MIME content type definition provides for the inclusion of authentication information for the purpose of authenticating the originator and recipient of messages containing the data synchronization content type. The content type definition supports Basic, Base64 userid/password mark-up, MD5 digest challenge and response strings and any other registered authentication credential scheme.

Threats: The SyncML MIME content type definition provides for the inclusion of remote execution commands. Administrators for MIME implementations that support this content type SHOULD take every standard precaution to assure the activation of the originator of SyncML content, as well as take every standard precaution to confirm the validity of the included remote execution command prior to allowing the command to be executed on the targeted recipient's system.

Interoperability considerations: Implementations that have support for the mandatory features of this content type will greatly increase the chances of interoperating with other implementations supporting this content type. Conformance to this content type requires an implementation to support every mandatory feature.

Published specification: URL:http://www.openmobilealliance.org/tech/docs

Applications, which use this media type: This MIME content type is intended for common use by networked data synchronization applications.

Additional information:

Magic number(s): None

File extension(s): XSM

Macintosh File Type Code(s): XSML
13.2 application/vnd.syncml+wbxml

To: ietf-types@iana.org

Subject: Registration of MIME media type application/vnd.syncml+wbxml

MIME media type name: application

MIME subtype name: vnd.syncml+wbxml

REQUIRED parameters: None

OPTIONAL parameters: charset, synctype, verproto, verdtd. May be specified in any order in the Content-Type MIME header field.

Content-Type MIME header.

charset Parameter

Purpose: Specifies the character set used to represent the SyncML document. The default character set for SyncML representation protocol is UTF-8, as defined [RFC2279].

Formal Specification: The following ABNF defines the syntax for the parameter.

```
chrset-param = ";" "charset" "=" <any IANA registered charset identifier>
```

synctype Parameter

Purpose: Specifies the data synchronization protocol used by the SyncML document. If present, the value MUST be the same value as that specified by the "SyncType" element type in the SyncML MIME content information. There is no default value.

Formal Specification: The following ABNF defines the syntax for the parameter.

```
stype-param = ";" "synctype" "=" text
```

verproto Parameter

Purpose: Specifies the major/minor revision identifiers for the SyncML synchronization protocol specification for the workflow of messages with SyncML MIME content. If present, MUST be the same value as that specified by the "VerProto" element type in the SyncML MIME content information. If not present, the default value "1.2" is to be assumed.

Formal Specification: The following ABNF defines the syntax for the parameter.

```
verprot-param = ";" "verproto" "=" 1*numeric "." 1*numeric
```
verDTD Parameter

Purpose: Specifies the major/minor revision identifiers for the SyncML representation protocol specification that defines the SyncML MIME media type. If present, MUST be the same value as that specified by the "VerDTD" element type in the SyncML MIME content information. If not present, the default value "1.2" is to be assumed.

Formal Specification: The following ABNF defines the syntax for the parameter.

```
verDTD-param = ";" "verDTD" "=" 1*numeric "." 1*numeric
text = 1*ALPHA
numeric = "0" / "1" / "2" / "3" / "4" / "5" / "6" / "7" / "8"/ "9"
```

Encoding considerations: The default character set for the SyncML MIME content type is UTF-8. Transfer of this character set through some MIME systems could require that the content is first character encoded into a 7bit character set with an IETF character encoding mechanism such as Base64, as defined in [RFC2045].

Security considerations:

Authentication: The SyncML MIME content type definition provides for the inclusion of authentication information for the purpose of authenticating the originator and recipient of messages containing the data synchronization content type. The content type definition supports Basic, Base64 userid/password mark-up, MD5 digest challenge and response strings and any other registered authentication credential scheme.

Threats: The SyncML MIME content type definition provides for the inclusion of remote execution commands. Administrators for MIME implementations that support this content type SHOULD take every standard precaution to assure the authentication of the originator of SyncML content, as well as take every standard precaution to confirm the validity of the included remote execution command prior to allowing the command to be executed on the targeted recipient's system.

Interoperability considerations: Implementations that have support for the mandatory features of this content type will greatly increase the chances of interoperating with other implementations supporting this content type. Conformance to this content type requires an implementation to support every mandatory feature.

Appendix A. [SYNTAX] Static Conformance Requirements (Normative)

The SCR tables in this Appendix form a profile of the Static Conformance Requirements.

Static conformance requirements (SCR) specify the features that are OPTIONAL and MANDATORY within implementations conforming to this specification.

Further static conformance requirements for the usage of this specification are specified in [DSPRO].

Appendix B. Example Validation Aids

Many of the examples of this document may be validated against the schema. Since the examples are generally incomplete, they need to be incorporated into an appropriate framework for this to work. Some of the frameworks used, and the examples that can validate with them are shown below.

B.1 Example Data Hierarchy

Figure 1 contains an example hierarchy of objects. This collection is either the starting point or the ending point for many of the examples.

![Figure 1 - Example of Hierarchy](image-url)
B.2 Inside Sync Element Examples

Examples for the following commands may be validated with this framework: Add, Del

```xml
<?xml version="1.0" encoding="UTF-8"?>
<SyncML xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="OMA-SUP-XSD_DS_Syntax_Schema-V2_0.xsd" Version="2.0">
   <SyncHdr MsgID="1" SessionID="100">
      <TargetServerURI>ServerURI GoesHere</TargetServerURI>
      <SourceClientURI>ClientIdentifier GoesHere</SourceClientURI>
   </SyncHdr>
   <SyncBody/>
</SyncML>
```
<Sync CmdID="1">
  <!-- Insert Example Below Here -->
  <!-- Insert Example Above Here -->
</Sync>
</SyncBody>
</SyncML>
