3 Terminology and Conventions

3.1 Conventions

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

All sections and appendixes, except “Scope” and “Introduction”, are normative, unless they are explicitly indicated to be informative.

This is an informative document, which is not intended to provide testable requirements to implementations.

3.2 Definitions

| Context Collaboration Model | An extension of the Context Model. It expands on the Context Model by describing the interactions (collaborations) between the entities of this architecture and external entities (e.g. entities in other architectures). |
| Contextual Item             | A logical entity in an architecture |
| Context Model               | A model that identifies all contextual items relevant to understanding architecture. |
| Group Management            | A generic list of URIs that can be used by different enablers to address all list members at once. They are stored and managed by the Shared XDM. Additional service specific semantics are defined by the using service itself with service specific extensions on the basis of additional XML documents. Due to the overloaded meaning of “Group Management”, it was decided to use “XML Document Management” (short form is XDM) to describe the service enabler that was defined. |
| Presence                    | Defined in [OMA-RD-Presence_SIMPLE] |
| Presence Information        | Defined in [OMA-RD-Presence_SIMPLE]. |
| Principal                   | An entity that has an identity, that is capable of providing consent and other data, and to which authenticated actions are done on its behalf. Examples of principals include an individual user, a group of individuals, a corporation, service enablers/applications, system entities and other legal entities. [OMA-DICT] |
| Subscription                | See [RFC3265] |
| XDM Client                  | The XDMC is a client entity that provides access to the various XDMS features. [See also 7.1.1 ] |
| XCAP Server                 | The XCAP Server manages XML documents. [See also 7.2.1 ] |

4. Introduction (Informative)

This Architecture Document describes the features and architecture of the OMA XML Document Management enabler.

The XML Document Management defines a common mechanism that makes user-specific service-related information accessible to the service enablers that need them. Such information is expected to be stored in the network where it can be located, accessed and manipulated (created, changed, deleted, etc.). XDM specifies how such information will be defined in well-structured XML documents, as well as the common protocol for access and manipulation of such XML documents. The XML Configuration Access Protocol (XCAP) [XCAP], as defined by IETF, has been chosen as the common XML Document Management protocol.

The XDM Specification [OMA-TS-XDM_Core] defines two main features:

- The common protocol, XML Configuration Access Protocol (XCAP), by which principals can store and manipulate their service-related data, stored in a network as XML documents.
- The SIP subscription/notification mechanism by which principals can be notified of changes to such documents.

Documents accessed and manipulated via XCAP are stored in logical repositories in the network, called XML Document Management Servers (XDMS). Each repository may be associated with a functional entity which uses its data to perform its functions. (For example, a POC server accesses a POC XDMS to obtain a particular type of user document, a POC Group document, which provides the member list for a POC group session, and uses this information to invite such members for a POC session.)

The Shared XDM Specification [OMA-TS-XDM_Shared] specifies a specific type of repository, called a Shared XDMS, which stores documents which can be reused by other enablers. This enabler specifies one such document: the URI List. This is a convenient way for a principal to group together a number of end user identities (e.g., “Friends” or “Family) or other resources, where such a list is expected to be reused by a number of different enablers.

Due to the reusable nature of the XDM enabler, there will be interactions with other service enablers, and therefore, the architectural design of the XDM enabler accommodates the needs of those enablers.

4.1 Target Audience

The target audience for this document includes but is not limited to the following:

- The Working Group(s) that will create specifications based on this subject matter
- Working Groups that need to understand this subject matter
  - OMA - POC WG
  - OMA - MWG
  - OMA – GS WG
  - OMA – DM WG
  - OMA – BAC WG
  - OMA – LOC WG
  - OMA – DS WG
  - OMA – MWS WG
- Architecture Working Group (e.g. during Architecture Reviews as defined in [ARCH-REVIEW], to determine compliance of [ARCH-PRINC], etc.)
- Interoperability Working Group (e.g. for early analysis of interoperability requirements)
4.2 Requirements

All the requirements as defined in the [OMA-RD-XDM] are met with this document.
5. Features

Documents accessed and manipulated via XCAP are stored in (logical) repositories in the network, called generically XML Document Management Servers (XDMS), each repository being associated with a functional entity which uses the data in its associated repository to perform its functions. For example, a POC server accesses a POC XDMS to obtain a particular type of user document, a POC Group document, which provides the member list for a POC group session, and uses this information to invite such members for a POC session.

The following sub-sections provide a high level description of the principal features of the XDM enabler.

5.1 Authentication

XDM clients must be authenticated before accessing any XDM services. Depending on the location of the XDMC (e.g. terminal or application server), this authentication may occur in multiple levels. For example, an XDMC located in a terminal is authenticated by the Aggregation Proxy using a particular mechanism. Alternatively an XDMC located in application server is authenticated directly by the XDMS using mechanisms outside the scope of the present specification.

5.2 Document Management Operations

This section describes the generic operations that can be performed on documents managed by the XDM enabler. The Document Management Operations should include the XCAP operations against XDMS. The XDM enabler supports the following operations that can be performed on a document:

- Creating or replacing a document
- Deleting a document
- Retrieving a document
- Creating or replacing an XML element
- Deleting an XML element
- Retrieving an XML element
- Creating an XML attribute for an XML element
- Deleting an XML attribute
- Retrieving an XML attribute

Note that some documents might not support all operations.

5.3 Notifications of changed data

This release of XML Document Management uses the SIP subscription/notification mechanism specified by IETF [xcap-diff] [sipping-config-framework], [XCAP_Config]. This allows an authorized XDM Client to subscribe to notification of changes to a document in an XDMS.

The XDM Client may subscribe to changes in multiple documents in a single subscription.

Section 7 provides details of the use of this feature across various reference points.
6. Context Model

6.1 Context Collaboration Model

6.1.1 Functions

The XDM enabler provides the following functionality:

1) Manipulation of XML documents stored in an XDM Server (XDMS) by the XDM Client (XDMC), and
2) Change notifications of XML documents, by which an XDMC can learn of any changes made to documents in the XDMS.

Manipulation of XML documents is achieved using the XCAP protocol, between the XDMC and the XDMS storing the data. Authentication is described in Section 5.1 An XDMC may subscribe to the changes done to XML documents using a SIP change event package. When an XDMC subscribes to the changes, it receives notifications from the XDMS whenever an XML document is changed. An XDMC may subscribe to a single or multiple documents with one subscription. The subscription request from the XDMC may be accepted or denied based on authorization decision by the XDMS.

6.1.2 Collaboration with other Service Enablers

The collaboration of the XDM enabler with other enablers has several aspects:

- Terminals use the aggregation proxy to communicate more efficiently with enabler-specific XDMSs as well as the Shared XDMS
- Enabler-specific applications servers directly communicate with the Shared XDMS using both XCAP and SIP-based interfaces.
- Enabler specifications utilize the XDM specifications to define their own XML documents. Enabler-specific applications servers communicate with XDMSs using both XCAP and SIP-based interfaces.
7. Architectural Model

7.1 XML Document Management Functional Entities

7.1.1 XML Document Management Client

The XDMC is a client entity that provides access to the various XDMS features as described in Section 5. An application implementing an XDMC may implement various subsets of those features, as required, subject to certain mandatory requirements described in [OMA-TS-XDM_Core].

The XDMC can be implemented in both terminal and server entities.

7.1.2 Aggregation Proxy

The Aggregation Proxy is the contact point for the XDM Client implemented in an UE to access XML documents stored in any XDMS. The Aggregation Proxy performs the following functions:

Figure 1: XML Document Management Architecture
Performs authentication of the XDM Client.
Routes individual XCAP requests to the correct XDMS
Optionally supports charging
Optionally performs compression/decompression over the radio interface

7.1.3 Shared XML Document Management Server

The Shared XDMS is a server entity providing the functionality described in Section 5. The Shared XDMS supports only URI Lists as described in [OMA-TS-XDM_Share].

7.2 Enabler specific Functional Entities

Each of these functional entities are defined in the specifications for the enabler in question

7.2.1 Enabler specific XML Document Management Server

The enabler specific XDMSs are XCAP Servers that supports the following functions:

- Performs authorisation of incoming SIP and XCAP requests
- Manages XML documents, which are specific to the service enabler.
- Provides aggregation of notifications of changes to multiple documents stored on the enabler specific XDMS.
- Notifies subscribers of changes to the enabler specific documents stored in the network.

7.2.2 Enabler specific Server

The functionality of the enabler specific Servers are defined in the specifications for the enabler in question.

7.3 External Entities Providing Services to XML Document Management

7.3.1 SIP/IP Core

The SIP/IP Core is a network of servers, such as proxies and/or registrars, that perform a variety of services in support of the XDM Service, such as routing, authentication, compression, etc. The specific features offered by different types of SIP/IP Core networks will depend on the particulars of those networks.

This release of the XDM enabler utilises IMS and MMD networks.

When the XDM Service is realized using IMS, the OMA XDM servers utilizes the capabilities of IMS as specified in 3GPP [3GPP TS 23.228] and 3GPP2 [3GPP2 X.S0013-002-A], respectively. In such cases the IMS network performs the following additional functions in support of the XDM Service:

- Routes the SIP signalling between the XDM Client and the XDM servers
- Provides discovery and address resolution services
- Supports SIP compression
- Performs a certain type of authorization of the XDM Client based on user’s service profile
- Maintains the registration state
• Provides charging information

7.3.2 Device Management Server

The Device Management (DM) Server [OMA-DM] performs initialisations and updates of all configuration parameters necessary for XDMC.

7.4 Description of Reference Points

7.4.1 Reference Point XDM-1: XDM Client – SIP/IP Core

The XDM-1 reference point supports the communication between the XDM Client and the SIP/IP Core network. The protocol for the XDM-1 reference point is SIP.

The XDM-1 reference point provides the following functions:

• Subscription to the modification of any XDM documents.
• Notification of the modification of any XDM documents.

When SIP/IP Core corresponds with 3GPP/3GPP2 IMS, the XDM-1 reference point conforms to the ISC reference point for XDM clients implemented in a server entity and to the Gm reference points for XDM clients implemented in terminal entities as specified in [3GPP TS 23.002] [3GPP2 X.S0013-000-A].

7.4.2 Reference Point XDM-2: Shared XDMS – SIP/IP-Core

The XDM-2 reference point supports the communication between the Shared XDMS and the SIP/IP Core. The protocol for the XDM-2 reference point is SIP.

The XDM-2 reference point provides the following functions:

• Subscription to the modification of shared XML documents.
• Notification of the modification of shared XML documents.

When SIP/IP Core corresponds with 3GPP/3GPP2 IMS, the XDM-2 reference point conforms to the ISC reference point [3GPP TS 23.002] [3GPP2 X.S0013-000-A].

7.4.3 Reference Point XDM-3: XDM Client – Aggregation Proxy

The XDM-3 reference point is between the XDM Client and the Aggregation Proxy. The protocol for the XDM-3 reference point is XCAP.

The XDM-3 reference point provides the following functions:

• XML document management (e.g. create, modify, retrieve, delete)
• Mutual authentication between XDMC and Aggregation Proxy

When the SIP/IP Core network corresponds with 3GPP/3GPP2 IMS, then the XDM-3 reference point conforms to the Ut reference point [3GPP TS 23.002] [3GPP2 X.S0013-000-A].

7.4.4 Reference Point XDM-4: Aggregation Proxy – Shared XDMS

The XDM-4 reference point is between the Aggregation Proxy and the Shared XDMS. The protocol for the XDM-4 reference point is XCAP.
The XDM-4 reference point provides the following functions:

- Shared XML document management (e.g. create, modify, retrieve, delete)

### 7.4.5 Reference Point DM-1: DM Client – DM Server

The DM-1 reference point is described in [OMA-DM]. The XDM enabler will define the XDM configuration object(s).

### 7.4.6 Reference Points: “Enabler specific XDMS” - SIP/IP Core

Each of these reference points are named by and defined in the specifications for the enabler in question.

They support the communication between an enabler specific XDMS and the SIP/IP Core network. The protocol for the reference points is SIP.

They provide the following functions:

- Subscription to the modification of enabler specific XML documents.
- Notification of the modification of enabler specific XML documents

### 7.4.7 Reference Points: “Enabler specific Server” - SIP/IP Core

Each of these reference points are named by and defined in the specifications for the enabler in question.

They support the communication between an enabler specific Server and the SIP/IP Core network. The protocol for the reference points is SIP.

They provide the following functions:

- Subscription to the modification of enabler specific XML documents.
- Notification of the modification of enabler specific XML documents

### 7.4.8 Reference Points: Aggregation Proxy – “Enabler specific XDMS”

Each of these reference points are named in the specification for the enabler in question and owned by it. The basic XML Document Management requirements for the reference points are described in the XDM core specification [OMA-TS-XDM_Core]. The enabler unique requirements for the reference points are described in the XDM enabler specification.

They provide the following functions:

- “Enabler specific” XML document management (e.g. create, modify, retrieve, delete)

### 7.4.9 Reference Points : Shared XDMS – “Enabler specific Server”

Each of these reference points are named in the specification for the enabler in question and owned by it. The requirements for the reference points are described in the XDM enabler specification [OMA-TS-XDM_Core] and in the enabler specific specification.

The protocol for the reference points is XCAP

They provide the following function:

- Transfer of URI Lists to the enabler specific server
7.4.10 Reference Points: “Enabler specific XDMS” – “Enabler specific Server”

Each of these reference points are named by and defined in the specifications for the enabler in question.

The protocol for the reference points is defined in the specifications for the enabler in question.

They provide the following function:

- Transfer of enabler specific documents from the enabler specific XDMS to the enabler specific server.

7.5 Access Control

This release of the XDM specifications defines a default access control policy, which is that only the creator of a document is allowed to perform all XDM actions to the document. Also application servers of the trusted networks are allowed to read the document. No other entities are allowed to access the document.

A permissions-based system, in which more elaborate access policies are defined, may be included in future releases of XDM.

7.6 Security

The XDMC is to be authenticated prior to accessing the XDM service as specified in [XCAP]. TLS is used as specified in [XCAP] in order to provide integrity and confidentiality protection to the exchanged messages. HTTP Digest is the default authentication mechanism.

For a 3GPP realisation the Generic Authentication Architecture (GAA) as an underlying network mechanism is used as specified in [3GPP TS 33.222] to provide the XDM service security if GAA is present; otherwise requirements as above applies.

7.7 Charging

Appropriate charging mechanisms may need to be provided by the underlying network or other suitable entities in order to support the charging requirements described in [OMA-RD-XDM].

Description of how charging is performed is beyond the scope of the present specification.

7.8 XML Document Management Service Provisioning

The XML Document Management (XDM) Service provider can set up the XDM Service configurations remotely in the terminal device by using the device management mechanism specified in [OMA-PRO-AD]. The updates of the XDM Service configurations are remotely performed in the terminal device by using [OMA-DM].

A UE running the XDMC, compliant with [OMA-PRO-UA] is able to receive the contents sent by the service provider. The exact syntax and definition of parameters needed for the XDM enabler are specified in [OMA-PRO-CONT]. The bootstrap mechanism defined in [OMA-PRO-SEC] and [OMA-DM] are used to enhance the security of the provisioning.
