# 1. Scope

This document is a combined document that includes requirements and architecture of the Dynamic Navigation (DynNav) v1.1 Enabler. The interfaces and functionalities of DynNav Enabler are specified in a separate document according to RESTful network API approach [OMA DN TS].

The DynNav Enabler provides an overall framework (mechanisms, functionalities, APIs, and etc.) to enable dynamic routing of vehicle based on traffic information.

The following areas will be covered as part of the scope of the enabler:

- Delivering traffic information and/or route information to the Navigation Application;
- Delivering value added information to the Navigation Application, such as Point Of Interest (POI);
- Security and privacy aspects.

DynNav Enabler will reuse as much as possible existing technologies. In particular, with respect to interface specification, it is in the scope of this Enabler:

- To reuse traffic information data formats defined by TPEG in [ISO TTI]

In DynNav 1.1, additional functionalities and information will be provided to improve the dynamic routing of vehicle.

## 3. Terminology and Conventions

### 3.1 Conventions

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

All sections and appendixes, except “Scope” and “Introduction”, are normative, unless they are explicitly indicated to be informative.

### 3.2 Definitions

DynNav Application/ Client	An entity that is in charge of interacting with a DynNav Server to get route information and/or real-time and forecast traffic information and complimentary data. Throughout this document client and application can be used interchangeably.
DynNav Server	An entity that is in charge of providing the DynNav Application with route information or real-time and forecast traffic information and complimentary data.
Lightweight ND	A navigation device that accesses a server for route estimation functionalities and for retrieving roads shape representation, if not available in a local maps database.
Location URI	A URI that enables the current location of a device to be obtained from a particular location server using a particular dereferencing protocol.
Navigation Device (ND)	An entity that, using the GNSS service, assists the driver showing correct route to reach the final destination. This entity may process real-time and forecast traffic information and dynamically estimates the optimal route, according to user preferences.
Network Performance Parameter	Information regarding the performances (i.e. speed, delay and travel time) of road segments related to an area or a route.
Point Of Interest	POI describes information about locations such as name, category, unique identifier, or civic address.
Route Information	Sequence of road segments, each of them defined with end points coordinates and road name, from an origin to a destination.
Smart ND	A navigation device that is able to calculate the route(s), using a roads network database available on the device itself.
Traffic Event	Information regarding events related to an area or a route that are either imposed or planned by the road network operator (i.e. roadwork leading to lane closures) or events that occur outside the control of the network operator (i.e. accidents).
Traffic Information	Information which consists of traffic events and network performance parameters related to an area or a route.

## 4. Introduction

Navigation Devices (NDs) represent a common tool in driving assistance. Dynamic navigation functionalities, based on real-time traffic information, have been indicated as the most valuable features in navigation device industry, being the reason for the popularity: reduction of the driving time, reduction of the fuel consumption, safety improvement.

The standardization forum ISO TPEG (Transport Protocol Expert Group) has defined a service for delivering real-time traffic information to NDs, publishing a complete set of technical specifications [ISO BIN] . In the service defined by TPEG, the traffic data is conveyed over a broadcasting communication channel; this choice, even if suitable in some cases, limits the service deployment for the following reasons:

- Unavailability in many countries of broadcasting bearers matching bandwidth requirements of the TPEG application;
- Broadcasting technology imposes constraints on the flexibility in data transmission, in particular in the resolution of road segments, in its geographic coverage and time span.

As part of the TPEG framework, the [ISO BIN] series defines the application and data structures to convey traffic information, in details:

- Travelling time for road segments between roads junctions;
- Traffic blockage on road segments, due to accidents and/or road work;
- Parking lots and public transportation information.

[ISO TTI] series issued by TPEG provide an XML encoding schema for info-mobility information entities defined in the [ISO BIN], which enable these XML structures to be used to access TPEG information over the (wireless) Internet. However, this results in an approach that mimics the simple download of a file containing traffic information, which implies a rather inefficient access because of the unavailability of filtering mechanisms that enable the selective access to the provided information.

In this technological scenario, delivering traffic information over mobile data network, with efficient bandwidth occupation, gains importance for mobile operators. Using a two-ways communication channel, customized traffic information and route information may be delivered to the ND according to journey parameters and selected time; route information may be updated along the drive, taking into account real-time and forecast traffic information. Mobile operators have the edge over other actors in delivering traffic and routing information, due to the fact that they can obtain traffic information by exploiting their own assets: two different strategies may be implemented by mobile operators to calculate driving times and delays for road segments:

- Anonymous tracking of mobile voice and data connection
- Tracking of GNSS enabled ND

Moreover, the DynNav Enabler represents an additional step toward the full support of navigation applications by OMA standardization framework: OMA enablers define functionalities exploited by navigation applications. A complete set of procedures for tracking and triggering is implemented in [OMA-SUPL], [OMA MLS], Assisted GNSS feature and high accuracy assistance (lane detection) have been defined respectively in [3GPP LPP] and [OMA LPPe] and supported by [OMA-SUPL].

### 4.1 Version 1.0

The version 1.0 of the DynNav Enabler defines an overall framework that enables dynamic vehicle-navigation-service based on traffic information over a mobile network.

The core functionalities exposed by the DynNav Enabler include the following operations:

- Request and Provide a set of routes based on the journey parameters defined by the user

- Provide traffic information related to the route and an area defined by the ND
- Provide complementary information (i.e. POI) related to defined routes and/or areas
- Manage subscriptions to notification services for updates on traffic information and alternative route proposal
- Provide security and privacy protection
- Provide route information to reach the 3<sup>rd</sup> party for Lightweight ND

## 4.2 Version 1.1

DynNav 1.1 supports the following functionalities additional to those in Version 1.0.

- Additional journey definition such as recurrent routes including time conditions and routes to the 3<sup>rd</sup> party for Smart ND
- Journey and route information sharing with interested 3<sup>rd</sup> parties through public resources
- Request and provide the optimal route to visit multiple waypoints complying with time and priority constraints
- Provide the list of POIs accessible within a defined travelling time/distance, and additionally related route information to the selected POI
- Supporting the common traffic information for reuse as opposed to the user-specific traffic information

## 5. Requirements (Normative)

The following subsections group the requirements in functional areas for the sake of document's readability. There is no architecture implication derived from the requirements grouping.

### 5.1 High-Level Functional Requirements

This section identifies the high-level functional requirements for the Dynamic Navigation enabler.

Label	Description	Release
DynNav-HLF-001	<p>The DynNav enabler SHALL be able to provide the user with a set of proposed routes and related traffic information to reach a final destination, based on following journey parameters:</p> <ul style="list-style-type: none"> <li>• Origin</li> <li>• Destination</li> <li>• Waypoints</li> <li>• Time</li> <li>• Date or Day(s) of week and, optionally, date interval</li> <li>• Road preferences (e.g. highways)</li> <li>• Vehicle type description (e.g. car, coach).</li> </ul> <p><b>Informational Note:</b> The journey may be referred to a specific time and date or being recurrent, defined in terms of time interval of the day, week days and date interval.</p>	1.1
DynNav-HLF-002	<p>The DynNav enabler SHALL allow a user to request traffic information related to a set of routes estimated by the ND, in the following scenarios:</p> <ul style="list-style-type: none"> <li>• Real-time (for dynamic routing)</li> <li>• Forecast (for journey planning).</li> </ul>	1.0
DynNav-HLF-003	<p>The DynNav enabler SHALL allow a user to request traffic information related and limited to a specific area (e.g. a neighbourhood, a metropolitan area, a region, etc.) in the following scenarios:</p> <ul style="list-style-type: none"> <li>• Real-time (for dynamic routing)</li> <li>• Forecast (for journey planning).</li> <li>• Default conditions for week days</li> </ul>	1.1
DynNav-HLF-004	<p>Traffic information delivered to the ND SHALL include at least traffic events (i.e. accidents, constructions, etc.) and network performance parameters (i.e. delay, speed for road segments) as defined in [ISO TTI].</p>	1.0
DynNav-HLF-005	<p>The DynNav enabler SHALL allow a user to select a set of routes for which being notified of related traffic information updates.</p> <p><b>Informational Note:</b> The route is selected among the ones proposed by the server or the ND.</p>	1.0
DynNav-HLF-006	<p>The DynNav enabler SHALL allow a user to be notified of an alternative route when specific conditions are met along previously selected routes.</p> <p><b>Informational Note:</b> Example of conditions that trigger notification of alternative route is traffic blockage.</p>	1.0
DynNav-HLF-007	<p>The DynNav enabler SHALL allow a user to disable location tracking procedure for the defined journey.</p> <p><b>Informational Note:</b> The way of executing the location tracking procedure is out of scope of DynNav enabler.</p>	1.0
DynNav-HLF-008	<p>The DynNav enabler SHALL allow a user to provide the server with a location URI in order to allow the server to access, if authorized, user's position information.</p>	1.0

DynNav-HLF-009	The DynNav enabler SHALL allow a user to receive information related to parking lots, public transportation, etc. according to the format defined in ISO [ISO TTI].	Future
DynNav-HLF-010	The DynNav enabler SHALL allow the user to request re-routing information as the user is deviating from the predetermined route.	1.0
DynNav-HLF-011	The DynNav enabler SHALL be able to encode the proposed routes in two different approaches: <ul style="list-style-type: none"> <li>• Full</li> <li>• Summarized.</li> </ul> <b>Informational Note:</b> Route information in summarized format is used in a preliminary stage to allow a user to select one preferred route out of a set of proposed routes. Thereafter the DynNav Server will provide the selected route information in full format to the DynNav client.	1.0
DynNav-HLF-012	The DynNav enabler SHALL provide different services based on the specific capabilities of the ND. <b>Informational Note:</b> For example the ND may make different requests to the DynNav Server on the basis if it is able to calculate routes or not.	1.0
DynNav-HLF-013	The DynNav enabler SHALL allow a user to request the route to the 3 <sup>rd</sup> party. <b>Informational Note:</b> This requirement is applicable to the Lightweight ND case only.	1.0
DynNav-HLF-014	The DynNav enabler SHALL allow a user to enable and disable the notification services based on the following parameters <ul style="list-style-type: none"> <li>• day time interval</li> <li>• date interval or days of week</li> <li>• expiring time</li> <li>• current user position</li> </ul> <b>Informational Note:</b> See Use Case B.6	1.1
DynNav-HLF-015	The DynNav enabler SHALL allow a user to request road congestion information according to data format defined by ISO TPEG in [ISO BIN](part 8)	1.1
DynNav-HLF-016	The DynNav enabler SHALL allow a user of the smart ND to request the route information to the 3 <sup>rd</sup> Party.	1.1
DynNav-HLF-017	The DynNav enabler SHALL allow a user to request the delivery of the trip and route information to the target 3 <sup>rd</sup> party.	1.1
DynNav-HLF-018	The DynNav enabler SHALL allow a user to request the route for visiting a list of points.	1.1
DynNav-HLF-018a	The DynNav server SHALL provide an optimized route for visiting a list of points based on real time and forecast traffic information according to time and priority constraints on points sequence provided by the user.	
DynNav-HLF-019	The DynNav enabler SHALL allow a user to request the shortest travelling time and the shortest travelling distance information for a destination, given the origin and time interval.	1.1
DynNav-HLF-020	The DynNav enabler SHALL enable a user to share trip and/or route information with interested 3 <sup>rd</sup> parties through public resources. The URL of public resources SHALL NOT be easily guessable. <b>Informational Note:</b> The way to convey the URL of public resources to interested 3 <sup>rd</sup> parties is out of scope of DynNav.	1.1
DynNav-HLF-021	The DynNav enabler SHALL allow 3 <sup>rd</sup> parties to subscribe to notification services for the shared trip and routes information.	1.1

DynNav-HLF-022	<p>The DynNav enabler SHALL allow a user to receive common traffic information of the selected road subnetwork.</p> <p><b>Informational Note:</b> ‘Common traffic information’ as opposed to ‘user-specific traffic information’ is provided to a group of users who are on a road subnetwork (e.g. highway) that is common to a group of users or plan to pass through it.</p>	1.1
----------------	---	-----

## 5.2 Requirements related to Points of Interest information

Label	Description	Release
DynNav-POI-001	The DynNav enabler SHOULD allow a user to receive information related to POI according to the format defined in W3C [W3C POI].	1.0
DynNav-POI-002	<p>The DynNav enabler SHALL allow a user to receive information related to POI according to the format defined in JSON Activity Stream [AS-JSON][AS-JSON].</p> <p><b>Informational Note:</b> The JSON Activity Stream POI format is used in OMA SNeW enabler [OMA SNeW], and it provides interoperability in the context of Social Networks applications.</p>	1.1
DynNav-POI-003	The DynNav enabler SHALL allow a user to read the POI category tree defined by the application provider.	1.1
DynNav-POI-004	The DynNav enabler SHALL allow a user to choose the content provider for POIs information among a list of content providers proposed by the DynNav service provider.	1.1
DynNav-POI-005	<p>The DynNav enabler SHALL allow a user to request the list of POIs, belonging to one or more POI categories, within a specified travelling distance or travelling time from an origin.</p> <p><b>Informational Note:</b> The travelling time to a POI is estimated by the DynNav server based on real time and forecast traffic information.</p>	1.1

## 5.3 Security & Privacy Requirements

Label	Description	Release
DynNav-PRI-001	The DynNav Enabler SHALL support mechanisms to ensure confidentiality of data transferred between the Principals.	1.0
DynNav-PRI-002	The DynNav Enabler SHALL support mechanisms to ensure data integrity of data transferred between the Principals.	1.0
DynNav-PRI-003	The DynNav Enabler SHALL support mechanisms to authenticate the Principals.	1.0

## 6. Architectural Model

This section defines the functional components and the interfaces of the DynNav enabler, thus providing its architecture, in alignment with the requirements that have been captured in the Requirements Section of this document. The architecture is described in the following sections.

### 6.1 Dependencies

Not Applicable

### 6.2 Architectural Diagram

The following figure represents the DynNav architecture, showing the DynNav interface and the DynNav components.

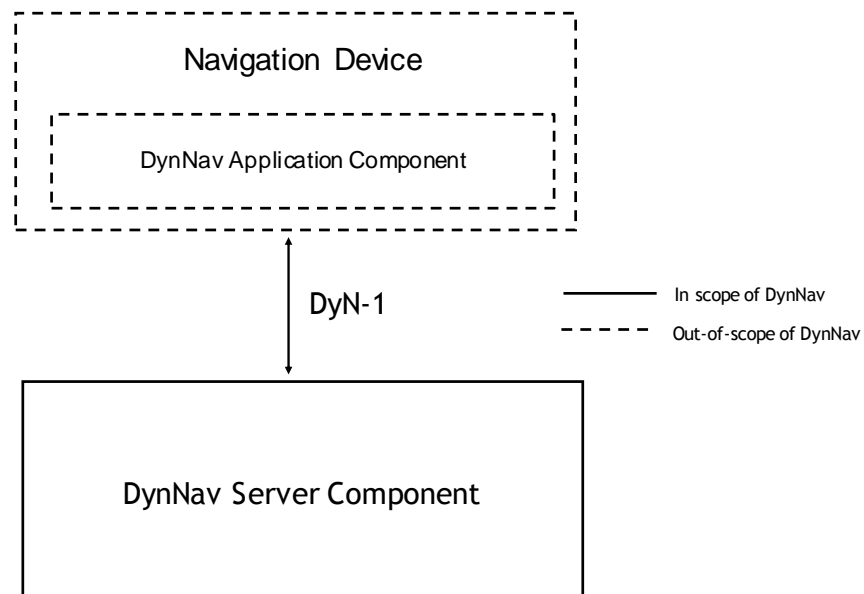

Figure 1: DynNav Enabler Architectural Diagram

## 6.3 Functional Components and Interfaces Definition

### 6.3.1 DynNav Server Component Description

The role of this component is to provide route and traffic information to the DynNav Application component. In addition, the DynNav Server component allows the DynNav Application component to be notified about updated traffic information, and the DynNav Application component will be notified about alternative routes in case the performances of proposed routes become degraded

The DynNav Server component performs the following functions:

1. Analysis of journey parameters defined by the DynNav Application component and proposal of a set of routes, based on real-time and forecast traffic information; the journey may be referred to a specific time and date or being recurrent (defined by an interval time, days of week, and working or vacation periods). The origin or destination may be defined by a target 3<sup>rd</sup> party's identifier (whose position has to be estimated by an external location server). The location of a POI (provided by the DynNav Server) may be also considered as the destination. For bandwidth

optimization, in a preliminary stage routes may be encoded according to a summarized format: full route information is delivered only for the route selected by the ND, out of proposed set. The route information at server level may be updated using user's current position information. Journey parameters may include a set of waypoints to visit with time and priority constraints (solution of the travelling salesman problem based on real time and forecast traffic estimation).

2. Provision of real-time and forecast traffic information related to a set of routes proposed by the DynNav Application component or by the DynNav Server itself. In case of the recurrent journey, the DynNav server provides traffic information assumed as ordinary/regular based on available road network measurements;
3. Provision of real-time and forecast traffic information related to one or more areas defined by the DynNav Application component;
4. New route proposition, in the following conditions:
  - Performances of current route become degraded;
    - in case of journey defined as recurrent, new route proposition can be disabled when user's position is not related to the proposed routes
  - User diverts and deviates from the on-going route;
  - In case the 3rd party ID is used as the destination (the 3rd party's position may not be static, the DynNav Server monitors the 3rd party's position and updates the proposed route when the 3rd party's position is changed);
5. Provisioning of complementary information (i.e. POIs) related to a route or an area, or within a defined travelling distance or time from an origin; complementary information may be provided by different sources (i.e. contents providers);
6. Notification service for the user of traffic information updates related to the set of routes defined in function #2;
7. Notification service for the user of traffic information updates, for areas defined in function #3;
8. Notification service for the user of new routes estimated in function #4;
9. Using the IP address or a location URI, provided by the DynNav Application component, to access the position information of the DynNav Application component, the DynNav Server component shall not access location procedures if disabled by the user;
10. Provision of the common traffic information for a designated road;
11. Provision of URLs of public resources used to share the route information with interested 3<sup>rd</sup> parties;
  - In case of route delivery to 3<sup>rd</sup> party scenario, the DynNav Server forwards the URL of public resources to the target 3<sup>rd</sup> party
12. Notification service toward subscribed 3<sup>rd</sup> parties of shared information updates in function #11, based on user's authorization policies.

Note that user and 3<sup>rd</sup> party tracking procedures are implemented through an enabler external to DynNav Server component.

Note that the user may access DynNav application data such as route information through 3rd party application server, for instance for planning a journey [Appendix C]. In this scenario the user just requests routing information based on forecast traffic information (procedures 1, 2, 3): it is not interested in real-time notification services.

Note that the way to convey the URL of public resources to interested 3<sup>rd</sup> parties, by DynNav Application or DynNav Server, is out of scope of DynNav (SMS, MMS, OMA PUSH and Social Networks are examples to deliver URL information).

Note that the notification to 3rd parties requires explicit authorization by the user. Two different implementation approaches are available:

- Authorization through a pop-up menu for each single event or,
- Permanent authorization, to avoid unsafe interaction between a human and a machine while driving. In this approach, the Navigation Device automatically detects when the user is driving through an alternative route with respect to the previous notified one, the DynNav Application will then trigger a notification procedure to 3<sup>rd</sup> parties.

### 6.3.2 DyN-1 Interface

This interface is the entry point to DynNav enabler for traffic and route information.

It operates in a request/response model; notification procedures for real-time information updates are also available

This interface supports the following type of procedures:

- Proposal of a set of routes based on journey parameters (origin, destination, 3<sup>rd</sup> party's ID, time or recurrence parameters, location of POI, or list of waypoints) defined by the user; routes may be encoded according to summarized format or full format
- Delivery of traffic information related to a set of routes defined by the DynNav Server components
- Delivery of traffic information related to a set of routes defined by the DynNav Application component
- Delivery of traffic information related to an area defined by the DynNav Application component.
- Delivery of complementary information (i.e. POI) from different contents providers related to defined routes or areas, or within a defined travelling distance/time from an origin
- Notification service for the following kind of events:
  - updates on traffic information related to an area
  - updates on traffic information related to a route
  - alternative routes proposal for the defined journey
  - route and trip update in case of route to the 3<sup>rd</sup> party
  - updated information request by the 3<sup>rd</sup> party in case of route delivery to the 3<sup>rd</sup> party
  - updated information retrieval by the 3<sup>rd</sup> party in case of route delivery to the 3<sup>rd</sup> party
- The notification service can be disabled if the user's position is not related to the proposed routes or defined area in case of journeys or areas defined as permanent
- Disabling the access at server level to user's location information through an external location application
- Sharing trip and route information with interested 3<sup>rd</sup> parties over public resources, and related notification service
- updated visiting order and optionally alternative routes proposal in case of a journey defined by a list of waypoints

Note that definition of the data is specified at the TS stage.

## 6.4 Security Considerations

DyN-1 interface is expected to be provided over secure connections, e.g. as secured by TLS (e.g. HTTPS), to ensure that the interface operations are only visible to the appropriate DynNav Application component.

DynNav SHOULD allow Service Provider's deployment to perform the specific security features below:

- mutual authentication of the DynNav Client and DynNav Server Component
- confidentiality and integrity protection in communication between DynNav Application component and DynNav Server Component

Note that how to achieve access control is implementation specific.

## 7. Release Information

### 7.1 Supporting File Document Listing

Doc Ref	Permanent Document Reference	Description
Supporting File		
[REST_SUP_DYNNNAV]	OMA-SUP-XSD_rest_DynNav-V1_1-20150804-A	XSD schema for XML data structure definition

Table 1: Listing of Supporting Documents in DynNav 1.1 Release

### 7.2 OMNA Considerations

The OMNA portal [OMNA] needs to maintain the following schema namespace into Schema Namespace Registry

Description	Registered URN	Schema Links
Dynamic Navigation	urn:oma:xml:rest:netapi:dynnav:1.1	<a href="http://www.openmobilealliance.org/tech/profiles/rest_netapi_dynnav-v1_1.xsd">http://www.openmobilealliance.org/tech/profiles/rest_netapi_dynnav-v1_1.xsd</a>

## Appendix A. Change History

(Informative)

### A.1 Approved Version History

Reference	Date	Description
OMA-ER-DynNav-V1_1-20150804-A	04 Aug 2015	Status changed to Approved by TP TP Ref # OMA-TP-2015-0122-INP_DynNav_V1_1_ERP_for_final_Approval

## Appendix B. Use Cases (Informative)

### B.1 Dynamic vehicle routing: traffic information delivery

This scenario aims at enabling users to interconnect a DynNav Application with a DynNav Server infrastructure that provides real-time and forecast traffic information. The users request traffic information (real-time and/or forecast) related to a specific area (e.g., in a city neighbourhood, or metropolitan area, a region, etc.) from the server. In this scenario the route estimation procedure is executed by the ND.

#### B.1.1 Short Description

The DynNav Application communicates to the DynNav Server the area of interest (e.g., a city neighbourhood, or metropolitan area, a region, etc.) for which it wishes to obtain information correlated with time information; the DynNav Application may optionally specify a set of preferences (e.g., no toll roads, vehicle type etc.). The DynNav Server selects the information related to the specified area and sends it to the DynNav Application. Traffic information includes performance parameters for road segments and traffic events. With this information the ND can estimate the optimal route(s) for the user. The user can subscribe to notification service: at a later stage the server will send updated traffic information to keep the DynNav Application aligned with real-time traffic flows and traffic events in the specified area.

The user may request information about Parking lots, public transportation, POI; this query is based on specified area of interest.

#### B.1.2 Market benefits

The user may benefit from this use case in terms of travelling time, cost saving and safety; the user may also be informed in real-time about parking lot, public transportation and POI (e.g. restaurants, petrol stations).

### B.2 Dynamic vehicle routing: routing information delivery

This scenario aims at enabling users to interconnect a DynNav Application with a DynNav Server infrastructure that provides routing information and associated traffic information. The DynNav Application provides journey parameters and the DynNav Server replies with optimal route information for that journey.

#### B.2.1 Short Description

The DynNav Application requests routing information from the DynNav Server, sending information about the journey, in terms of origin/its current position, final destination, road preferences and vehicle type. The DynNav Server, based on available real-time and forecast traffic data, estimates the optimal route(s) with related network performance parameters and traffic events; the data are sent to the DynNav Application. From the proposed set of routes, the user deletes the ones it is not interested in and subscribes to notification service to receive updated information about:

- Network performance parameters and traffic events for the set of route(s)
- Alternative routes in case of traffic anomalies (e.g. delay or blockage) on current selection, if available.

In a different implementation, a preliminary set of routes is proposed by the DynNav Application without access to real-time traffic information. For those routes, the DynNav Server is requested to provide estimated performance parameters and traffic events. As in the previous scenario, the user may then remove the routes he is not interested in and he may subscribe to notification service to receive updated traffic information and/or alternative routes proposals.

If the DynNav Server tracks the DynNav Application position or the DynNav Application periodically updates its current position, the DynNav Server can update in real-time the route information related to the specific navigation session, deleting routes not consistent with the DynNav Application current position and deleting road segments already travelled from the routes description.

The user may request information about parking lots, public transportation, and POI (restaurants, petrol stations) related to selected routes.

## B.2.2 Market benefits

The user may benefit from this application in terms of travelling time optimization, cost saving and safety; the user may also be informed in real-time about POI and parking lot, restaurants, etc.

## B.3 Traffic monitoring

With the consensus of the users, the service provider may track the DynNav Applications and create real-time maps of traffic flows.

### B.3.1 Short Description

The user communicates its availability to be tracked by the server for real-time traffic information estimation at server level; the server subscribes to the DynNav Application for tracking procedure, defined in [OMA-SUPL] [OMA MLS], to collect position and velocity data. With this information the server estimates information on traffic flows on the road network (road segments delays and traffic blockage).

### B.3.2 Market benefits

The service provider is able to collect valuable data, create a real-time traffic map, and exploit these data to provide value added information.

## B.4 Re-route Request

This scenario aims at enabling the DynNav Application to re-route when the vehicle which has the ND is diverting and deviating from the on-going route.

### B.4.1 Short Description

When a user is guided by the predetermined route provisioned by the DynNav Server, the user may change the route by turning the wrong direction or on purpose while driving. Under the circumstances, the DynNav Application is able to recognize the situation that the vehicle is deviating from the route (e.g. the algorithm for detecting deviations is the out of scope of this enabler), and then, the DynNav Application may request re-route information to the DynNav Server simply based on the current position of the vehicle and the preset destination.

### B.4.2 Market benefits

Using the re-route request, the service provider is able to optimize the use of network bandwidth and the overload of the DynNav Server can be also reduced since the DynNav enabler does not need to create a new trip and other subsequent procedures (e.g. subscription).

## B.5 Summarized route delivery

This scenario aims at enabling the DynNav Server to provide the summarized routing information for saving the network bandwidth.

### B.5.1 Short Description

Since only a selected or preferred route, out of a set of routes proposed by the DynNav Server to the user, is used as routing information for a journey, full format encoding of the all set of routes represents redundant information from the network standpoint. In a preliminary stage, the DynNav Server should provide to the user a set of summarized routes and only the selected route will be provided to the user encoded in the full format.

The summarized route allows reducing the size of the route data provided because the summarized route may consist of the small number of high significant segments out of full road segments.

Normal Flow:

1. The user defines the journey parameters and the DynNav Application submits a request from the DynNav Server to acquire a set of proposed routes.
2. The DynNav server estimates a set of routes and summarizes the estimated routes and sends the set of summarized routes to the DynNav Application (which are much lighter than full format routes).
3. The user can see the summarized routes on the screen and selects a route out of the proposed routes it is interested in and the DynNav Application reports the route selection to the DynNav server.
4. The DynNav server sends only the selected route in full format providing detailed information for the route.

## B.5.2 Market benefits

The method allows the service provider to save its bandwidth and reduce the time to transmit the potentially unused set of fully described routes.

## B.6 Notification for frequently used routes or areas

This scenario aims at enabling the DynNav application user to permanently request traffic information for one or more routes or area, limiting unnecessary repetitive interaction with the device.

### B.6.1 Short Description

The user may be interested in traffic information related to a routes or area over long periods of time, for example for retrieving every morning information related to the route from home to work premises: the user will be automatically notified when traffic conditions on the preferred routes and alternative ones, or area as well, differ from those assumed as reference (default conditions). The notification service may be restricted to specified hours of the day, days of weeks, or be enabled only in case the position of the user is compatible with the subscribed routes or area: the user may choose to receive updated information only in case he is driving along the route or he is close to it (i.e. still at home). In case he is elsewhere in a totally different place, no notification has to be sent.

### B.6.2 Market benefits

This feature improves the Navigation application user experience. The user does not need to access the DynNav service every time he is travelling along the same route with annoying procedures, the traffic information is provided just in case is considered valuable (i.e. unusual traffic behavior). Moreover, the feature allows optimization of throughput over the mobile network: with its implementation useless road traffic queries are avoided (no data is sent when traffic conditions are those assumed as reference).

## B.7 Journey and Route information sharing with 3rd parties

This scenario aims at enabling the DynNav application to request the server to share journey and route information with 3<sup>rd</sup> parties.

### B.7.1 Short Description

The DynNav user may be interested in sharing journey and route information with interested 3<sup>rd</sup> parties. The DynNav application requests providing journey and route information to interested 3<sup>rd</sup> parties from the DynNav server, Journey and route information may be related to real time context or represents planned displacements. Social networks buddies lists represent an example of 3<sup>rd</sup> parties interested in accessing user's journey and route information. Another example of route sharing exploitation is the forwarding to the target 3<sup>rd</sup> party: the DynNav server acquires the current position of the 3<sup>rd</sup> party and it is used as an origin of the trip and for route estimation, and route information will be shared with the target 3<sup>rd</sup> party.

### B.7.2 Market benefits

The service provider will benefit from this use case in terms of enhanced functionality in the following scenarios:

- Route delivery to target 3<sup>rd</sup> party

- Integration with social network applications

## **B.8 Route information for visiting multiple points**

This scenario aims at enabling the DynNav application to request the route information for visiting a list of points including time and/or priority constraints.

### **B.8.1 Short Description**

The user may plan to visit a list of points (e.g. travelling salesman problem). If the DynNav application requests the route information to visit multiple points (i.e. multiple waypoints) with time and/or priority conditions, the DynNav server will provide the optimal route to the DynNav application based on the real time and/or forecast traffic information according to time and/or priority constraints provided by the user. In this scenario, the user may not define any specific destination. If the destination is not defined by the user, one of multiple points will be considered as a destination. A notification of changed traffic conditions and routes is also supported as well.

### **B.8.2 Market benefits**

The service provider will benefit from this use case in terms of resolving the travelling salesman problem based on real time and forecast traffic information.

## **B.9 Navigation information to POIs**

This scenario aims at enabling the DynNav application user to request from the server the list of POIs, for selected POI categories within a specified travelling distance and/or travelling time, given an origin. The user may also be interested in route information to reach one or more POI presented by the server. The travelling time and the route to the POIs are estimated by the server processing available real time and/or forecast traffic information.

### **B.9.1 Short Description**

The user may be interested in requesting the list of POIs, for a selected POI category (i.e. Italian restaurant), within a specified time and/or travelling distance, the origin point and the vehicle type (e.g. car, pedestrian, motorbike etc.) also have to be defined in the query. The DynNav server presents to the user the list of POIs matching the query parameters (POI category, origin, travelling time, transportation), the user may request from the server the route information to one or more received POIs. All the information (i.e. POIs list and related routes) provided by the DynNav server is based on real time and/or forecast road network delays available on the DynNav server itself. Through subscribing to notification service for the proposed route, the user will receive related real time traffic information and route information updates.

### **B.9.2 Market benefits**

This use case extends the service features available in the Navigation applications and it may represent a way for the exploitation of real time and forecast traffic information available on the navigation server.

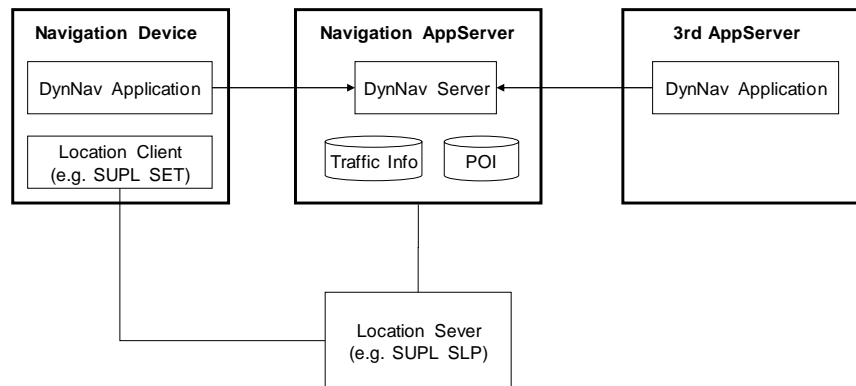

## Appendix C. Deployment Diagram (informative)

The following figure presents a possible deployment scenario. The DynNav Application may reside in a Navigation Device or in a 3<sup>rd</sup> party application server as part of the Navigation AppServer, the network element providing the navigation service to the final user.

The main application related to the case where the DynNav Application resides in the Navigation Device is turn-by-turn vehicle navigation. In this application, firstly, the user requests route and traffic information and then subscribes to notification service to receive real-time traffic information and alternative route proposal. Furthermore, the DynNav Application may provide real-time position information to the Navigation AppServer, updating journey information or through an external application (e.g. SUPL), and the DynNav Server uses location information in order to

1. Update the set of proposed routes created for a specific user,
2. Estimate network performance parameters on the roads on the basis of the NDs tracking information.

On the other side, the main application related to the case where the DynNav Application resides in an 3<sup>rd</sup> party application server is represented by journey planning tools offered through the web: the end user will access real-time traffic information and routing information through a web interface exposed by the 3<sup>rd</sup> party application server, the 3<sup>rd</sup> party application server will access the requested route and traffic information through the DynNav interface(DyN-1), acting as a DynNav Application. In this scenario, the user is not interested in notification services.

**Figure 2: Deployment Diagram**

## Appendix D. Flow (informative)

### D.1 Routing information delivery Call Flow

The figure below describes the message flow for a possible implementation of use case B.2 (Routing information delivery) and B.4 (Re-route Request).

In the example, the DynNav Application asks for navigation data (e.g. route information) to the DynNav Server. The user sets journey parameters, (starting point, destination and other preferences); those parameters are sent to the DynNav Server. The DynNav Server will reply with a set of routes matching up with journey parameters and related traffic information (network performance parameters and traffic events). The user then selects one or more proposed routes, and subscribes to notification service for receiving updated traffic information and alternative routes proposals.

The DynNav Server will then provide the client with real-time and forecast traffic information updates for the proposed routes, over the notification procedure.

Due to a traffic jam on the selected route, the DynNav Server proposes an alternative route to the DynNav application. The DynNav Server will automatically update its subscription settings related to the DynNav Application adding the alternative route in the subscribed resources set. This implicit subscription procedure is recommended for safety reason in automotive applications.

Afterwards, the user diverted from the selected route by turning the wrong direction or on purpose. The DynNav Application will request new routing information and related traffic information to the DynNav Server.

The flow diagram provided below also applies to following use cases and scenario of DynNav exploitation:

- Route information for visiting multiple points [B.8]
- notification for frequently used routes or areas [B.6]
- Route to the 3<sup>rd</sup> party for Lightweight ND

**Figure 3: Data Operation Call Flow (B.2 and B.4)**

This call flow is triggered by a request to access real-time routing information and related traffic data as described in [B.2, B.4, B.6 and B.8].

1. The user defines the journey parameters. Journey may be related to a defined time and date or being recurrent defining a time interval in a selected week day. The journey may also be defined as a list of waypoints to visit with time and priority constraints.
2. The DynNav Application submits a query to the DynNav Server to access route information and related traffic information, providing the server with journey parameters.
3. The DynNav Server estimates a set of routes for the defined journey.
4. The DynNav Server generates performance parameters and traffic events related to the estimated routes previously.
5. The DynNav Server proposes a set of routes with related traffic information encoded in the full format to the client.
6. The user selects the routes it is interested in.

7. The DynNav Application subscribes to notification service to receive real-time information about;
  - a) Traffic information for the route the user has selected
  - b) Alternative route proposal, whenever performance of proposed routes becomes degraded. In case of route proposal for a list of waypoints, a different visiting order may be proposed as well.

In case of subscription for a journey defined as permanent, the DynNav application may request to be notified of traffic and alternative route information only in case the user's position approaches related routes.

In this procedure, the DynNav Application may provide the DynNav Server with a location URI that is used by an external location application for tracking procedures based on the consensus of the user.

8. For the selected route, the DynNav Server estimates real-time and forecast traffic information (traffic events and network performance parameters).
9. The DynNav Server updates on traffic information related to selected route are notified to the DynNav Application.
10. When performances of a proposed route become degraded, the DynNav Server estimates alternative route proposal, if available.
11. The alternative route is provided to the DynNav Application by the DynNav Server. The subscription settings are implicitly updated in the server in order to provide real-time traffic information for the alternative route.
12. The ND detects that the vehicle is diverting and deviating from the predetermined route.
13. The DynNav Application automatically submits the re-route request to update the route accordingly to current position.
14. The DynNav Server re-estimates the route and traffic information related to the re-route request, based on the current position of the user.
15. The DynNav Server proposes a route with related traffic information to the DynNav Application. The subscription settings are also implicitly updated in the DynNav Server.
16. The session is closed by the DynNav Application.

## D.2 Traffic information delivery Call Flow

The figure below describes the message flow for a possible implementation of use case B.1 (traffic information delivery) and use case B.4 (Re-route Request) in case the routes are proposed by the DynNav Application.

In this scenario, the DynNav Application calculates a route that matches journey parameters defined by the user and it requests related traffic information from the DynNav Server. Based on traffic information provided by the server, the DynNav Application assumes the route as the reference one. Then the DynNav Application subscribes to notification service for receiving traffic information updates related to the route, confirming that it allows to be tracked by the DynNav Server.

At a given point, an accident on the reference route will trigger a notification message from the DynNav Server toward the DynNav Application. Upon updated traffic information, the DynNav Application estimates an alternative route and asks for traffic information to the DynNav Server. Since the new route appears to be rather congested, the DynNav Application estimates a second alternative route and asks again traffic information to the DynNav Server. At the moment, the answer satisfies the user and the DynNav Application removes the old route not to receive related notifications.

Furthermore, the user diverts from the route and the DynNav Application will automatically estimates a new route and submit it to the DynNav Server and the DynNav Server provides the real-time traffic information regarding the re-estimated route and the subscription parameters are updated by the DynNav Application.

The flow diagram provided below also applies to following scenario of DynNav exploitation:

- Route to the 3rd party for Smart ND

Figure 4: Data Operation Call Flow (B.1 and B.4)

This call flow is triggered by a request to access real-time traffic data related to a set of routes proposed by the ND as described in [B.1 and B.4].

1. The ND estimates a route.
2. The DynNav Application submits a query to the DynNav Server to access traffic information related to the estimated route.
3. The DynNav Server generates network performance parameters and traffic events related to the received route.
4. The DynNav Server sends the DynNav Application the traffic information related to the proposed route.
5. The DynNav Application evaluates the received traffic information and assumes the route as reference one.
6. The DynNav Application subscribes to notification service to receive real-time information about traffic information for the reference route. In this procedure, the DynNav Application also provides the DynNav server with a location URI that is used by an external location application for tracking procedures.
7. An accident occurs along the reference route, the DynNav Server estimates updated traffic information for the route (e.g. delays for each road segments).
8. The DynNav Server notifies to the DynNav Application updated traffic information along the reference route.
9. The ND evaluates the received information.
10. If the DynNav Application reckons that performances are heavily degraded, it estimates alternative route.
11. The DynNav Application submits a query to the DynNav Server to access traffic information related to the alternative route.
12. The DynNav Server generates performance parameters and traffic events related to the received route.
13. The DynNav Server sends the DynNav Application the estimated traffic information.
14. The ND evaluates the received information and reckons that performances of the new routes do not have any advantage over to previous one.
15. The DynNav Application deletes the last proposed route since there is no interested in.
16. The ND estimates a second alternative route.
17. The DynNav Application submits a query to the DynNav Server to access traffic information related to the second alternative route.
18. The DynNav Server generates performance parameters and traffic events related to the received route.
19. The DynNav Server sends the ND the estimated traffic information.
20. The DynNav Application evaluates the received traffic information and reckons that the last proposed route has advantage over the previous ones and the DynNav Application assumes this alternative route as the reference one. The DynNav Application will automatically receive traffic information updates related to the new route.
21. The previously proposed route is deleted since it is no more the reference one.
22. The ND detects the vehicle is deviating from the reference route. The ND automatically estimates a new route based on the current position of the ND.
23. The DynNav Application submits a query to the DynNav Server to access traffic information, providing the DynNav Server with the estimated route.
24. The DynNav Server generates performance parameters and traffic events related to the received route.
25. The DynNav Server sends the DynNav Application the estimated traffic information.

26. The DynNav Application evaluates the received traffic information and it assumes the new route as the reference one. The ND will automatically receive traffic information updates related to the new route.
27. The session is closed by the ND.

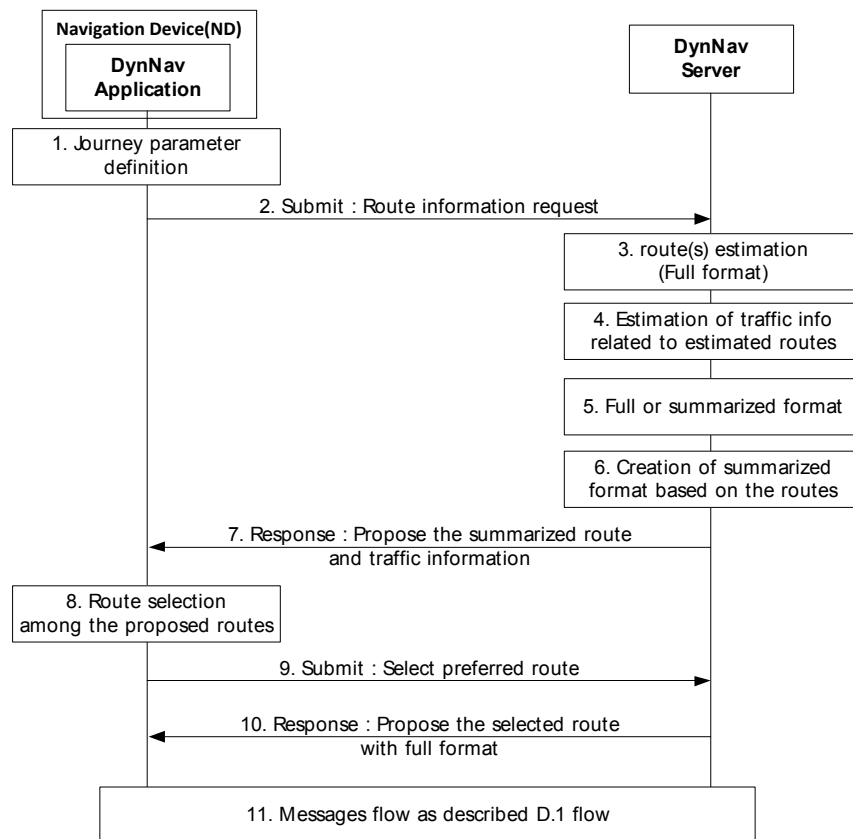

### D.3 Summarized Route Delivery Call Flow

This section describes the message flow for delivering a set of summarized routes to the DynNav Application (use case B.5).

In this flow, the DynNav Server uses the summarized encoding format for the first delivery of route information to the ND; this choice allows optimization of bandwidth and response time with respect of full encoding approach. The DynNav Server may choose the encoding format based on journey parameters (i.e. journey length) and implementation dependant conditions.

When the DynNav Application has received the set of summarized routes, it selects the ones it is interested in; and then it will request from the server the full description of the selected routes.

The remaining part of DynNav application call flow remains the same as the flow D.1.

**Figure 5: Data Operation Call Flow (B.5)**

This call flow is triggered by a request to access real-time routing information and related traffic data, in the first stage of the information is encoded according to summarized format described in [B.5].

1. The user defines journey parameters.
2. The DynNav Application submits a query to the DynNav Server to access route information and related traffic information, providing the DynNav Server with the journey parameters.
3. The DynNav Server estimates a set of routes according to full format based on the defined journey parameters.

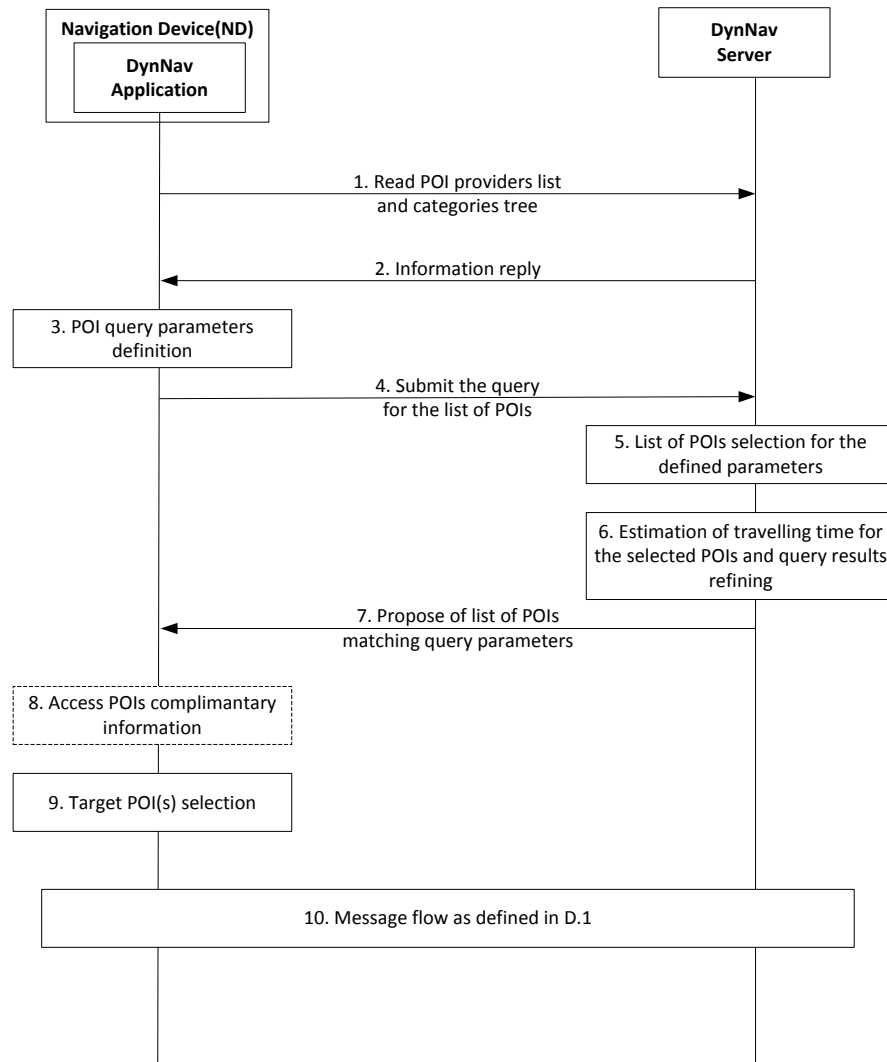

4. The DynNav Server generates performance parameters and traffic information related to the set of proposed routes.
5. The DynNav Server determines that the summarized route format is sent to the DynNav Application.
6. The DynNav Server encodes the set of proposed routes according to the summarized format.
7. The DynNav Server sends the summarized routes and related traffic information to the DynNav Application.
8. The user selects a preferred route among the proposed set.
9. The DynNav Application requests the full description of the selected route from the DynNav Server.
10. The DynNav Server sends the full description of the route to the DynNav Application.

The message flow of a typical application should continue as described in flow D.1, (in the steps from 7 to 17).

## D.4 Accessible POIs within a defined travelling time/distance Call Flow

The figure below describes the message flow for a possible implementation of use case B.9 (Navigation information to POIs).

In the example, the DynNav Application requests a list of POIs (for selected POI provider and/or categories) from the DynNav Server including the query parameters (origin, time and date, POIs categories, maximum travelling time/distance). The DynNav Server will select the list of POIs (for defined POI provider and categories) that can be reached within the travelling time or travelling distance defined by the DynNav User, based on available real time and/or forecast traffic information. The DynNav server will reply with the list of POIs matching up with query parameters. The user accesses complementary POIs information (e.g. recommendations) through functionalities external to the DynNav (e.g. OMA SNeW). Then, for the POI (one or more) in which the user is interested, the DynNav application requests route information and related traffic information (network performance parameters and traffic events) from the DynNav server. (See D.1 Routing information delivery Call Flow).

**Figure 6: Data Operation Call Flow (B.9)**

This call flow is triggered by a request to access information about available POIs accessible within the travelling time or travelling distance defined by the user as described in [B.9].

1. The DynNav Application requests the available POI content provider and the category tree adopted by the DynNav Server.
2. The DynNav Server replies with the requested information.
3. The user sets the parameters for the POI query: POI provider, categories (e.g. Japanese restaurants), origin, time and date, travelling time/distance, transportation (e.g. car, motorbike).
4. The DynNav Application submits the query to receive POIs information which is accessible within the defined travelling time or travelling distance.
5. The DynNav Server generates a first list of POIs located in the area defined in the query.

6. The DynNav Server selects the information to be provided based on available real time and/or forecast traffic information (network performance parameters and traffic events), as output, a list of available POIs within the defined travelling time or travelling distance is provided. For each POIs the travelling distance from the origin and the estimated travelling time are also provided.
7. The DynNav Server provides the selected POIs information.
8. The user accesses to complimentary information for the POIs provided by the DynNav Server (e.g. recommendations), exploiting functionalities external to DynNav (e.g. SNeW [OMA SNEW], or WWW access).
9. The user selects the POI(s) which the user is interested in.

The message flow of a typical application should continue as described in flow D.1, (in the steps from 1 to 17), assuming that parameters in POI query (origin, time and date, transportation) are used as journey parameters and the target POIs are considered as a destination (selected in step 9).

## D.5 Routing information delivery Call Flow

The figure below describes the message flow for possible implementation for sharing journey and route information with interested third parties (use case B.7).

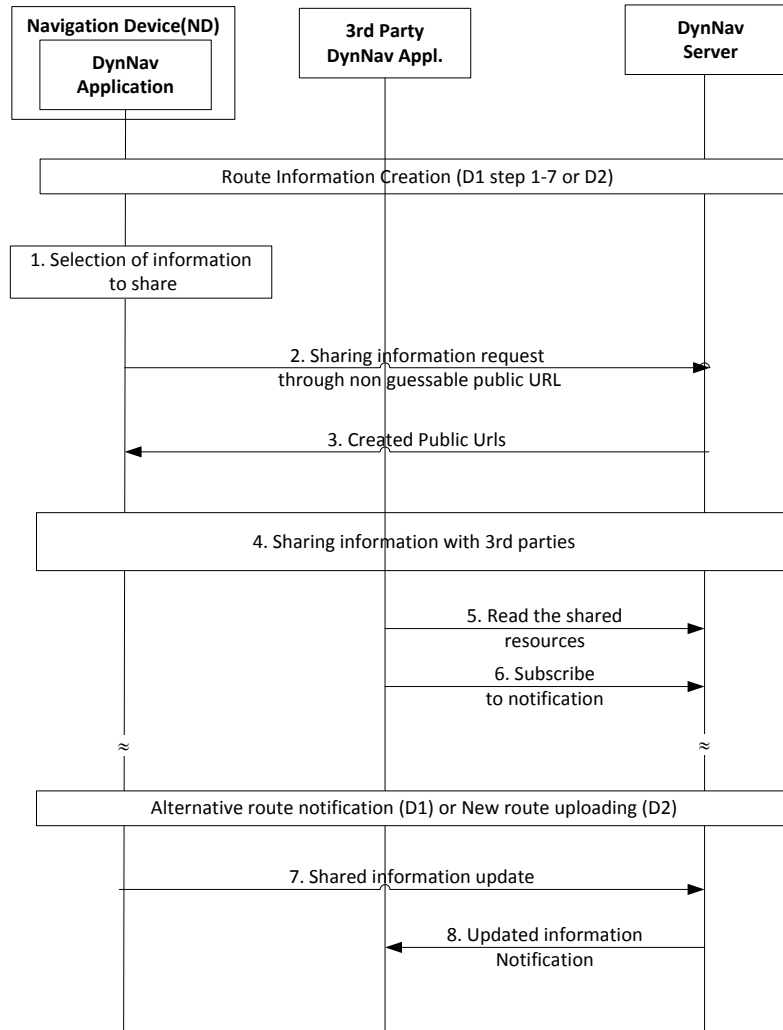

Information sharing can be implemented in the DynNav enabler through public resources. The DynNav server exposes public resources including journey and route information over the URL of public resources non-easily guessable. There are two approaches to share the information, (i.e. sending the URL of public resources to interested 3<sup>rd</sup> parties) as below:

- Route delivery by the DynNav Server: the DynNav Server directly sends the URL of public resources to the target 3<sup>rd</sup> party through functionalities external to the DynNav enabler, such as SMS, MMS, or OMA Push
- Route sharing by the DynNav Application: after the DynNav Server provides the URL of public resources to the DynNav Application, the DynNav Application shares it with interested 3<sup>rd</sup> parties through Social Network running on the device apps with integrated Social Network [OMA SNeW] and DynNav functionalities

The interested 3<sup>rd</sup> parties may read the information by accessing public resources and they may subscribes to notification service for updated information if notification services are permitted by the user. The user will be notified in case the reference route for the defined journey is modified by the DynNav Server or by the DynNav Application. A notification to 3<sup>rd</sup> parties procedure may also be used to update the user position along the route; the user position on the DynNav Server may be estimated through external enabler (i.e. SUPL) or updated by the user itself.

The procedures to generate journey and route information are the reference ones described in sequence diagram D.1 (steps 1-7) or D.2 (overall flow).

**Figure 7: Data Operation Call Flow (B.7)**

This call flow describes the case that the DynNav Application shares the URL of public resources with interested 3<sup>rd</sup> parties. This call flow is triggered by a request to share journey and route information as described in [B.7]. Journey and related route information to be shared are created with a procedure described in D.1 (step 1-7) or D.2.

1. The user defines the information the user wishes to share and may enable the notification procedures towards 3<sup>rd</sup> parties. The authorization for notifications may be event based or remitted to the DynNav Application, in order to avoid unsafe interactions between the human and the machine while driving. The user may also enable notifications for position updates along the route, based on travelled distance or periodic.
2. The DynNav Application requests the server to share journey and route information with 3<sup>rd</sup> parties through public resources. The DynNav Application may also enable the option for the 3<sup>rd</sup> parties to subscribe to notification services.
3. The DynNav Server provides the created URL of the public resources containing journey and route information to the Application.
4. The user shares the received URL of public resources with interested 3<sup>rd</sup> parties
5. The 3<sup>rd</sup> party's DynNav application reads journey and route information.
6. The 3<sup>rd</sup> party's DynNav application subscribes to notification services, if enabled by the user. The 3<sup>rd</sup> parties set the information desired to be notified: alternative route, position update along the route.

Based on real time traffic information available on the DynNav Server, alternative route may be proposed by the DynNav Server (D.1 step 10-11) or uploaded by the DynNav Application (D.2). The user position at DynNav Server is refreshed either by the user itself or through an external positioning enabler (i.e. SUPL).

7. The DynNav Application authorizes a notification procedure towards 3<sup>rd</sup> parties, if subscribed by any 3<sup>rd</sup> parties. This step is skipped in case of a journey automatic notification.
8. The DynNav Server notifies the updated route information, and/or the position along the route to 3<sup>rd</sup> parties' DynNav Application.
