Use of this document is subject to all of the terms and conditions of the Use Agreement located at <http://www.openmobilealliance.org/UseAgreement.html>.

Unless this document is clearly designated as an approved specification, this document is a work in process, is not an approved Open Mobile Alliance™ specification, and is subject to revision or removal without notice.

You may use this document or any part of the document for internal or educational purposes only, provided you do not modify, edit or take out of context the information in this document in any manner. Information contained in this document may be used, at your sole risk, for any purposes. You may not use this document in any other manner without the prior written permission of the Open Mobile Alliance. The Open Mobile Alliance authorizes you to copy this document, provided that you retain all copyright and other proprietary notices contained in the original materials on any copies of the materials and that you comply strictly with these terms. This copyright permission does not constitute an endorsement of the products or services. The Open Mobile Alliance assumes no responsibility for errors or omissions in this document.

Each Open Mobile Alliance member has agreed to use reasonable endeavors to inform the Open Mobile Alliance in a timely manner of Essential IPR as it becomes aware that the Essential IPR is related to the prepared or published specification. However, the members do not have an obligation to conduct IPR searches. The declared Essential IPR is publicly available to members and non-members of the Open Mobile Alliance and may be found on the “OMA IPR Declarations” list at <http://www.openmobilealliance.org/ipr.html>. The Open Mobile Alliance has not conducted an independent IPR review of this document and the information contained herein, and makes no representations or warranties regarding third party IPR, including without limitation patents, copyrights or trade secret rights. This document may contain inventions for which you must obtain licenses from third parties before making, using or selling the inventions. Defined terms above are set forth in the schedule to the Open Mobile Alliance Application Form.

NO REPRESENTATIONS OR WARRANTIES (WHETHER EXPRESS OR IMPLIED) ARE MADE BY THE OPEN MOBILE ALLIANCE OR ANY OPEN MOBILE ALLIANCE MEMBER OR ITS AFFILIATES REGARDING ANY OF THE IPR'S REPRESENTED ON THE “OMA IPR DECLARATIONS” LIST, INCLUDING, BUT NOT LIMITED TO THE ACCURACY, COMPLETENESS, VALIDITY OR RELEVANCE OF THE INFORMATION OR WHETHER OR NOT SUCH RIGHTS ARE ESSENTIAL OR NON-ESSENTIAL.

THE OPEN MOBILE ALLIANCE IS NOT LIABLE FOR AND HEREBY DISCLAIMS ANY DIRECT, INDIRECT, PUNITIVE, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES ARISING OUT OF OR IN CONNECTION WITH THE USE OF DOCUMENTS AND THE INFORMATION CONTAINED IN THE DOCUMENTS.

# 1. Scope

The Mobile Location Protocol (MLP) is an application-level protocol for getting the position of mobile stations (mobile phones, wireless personal digital assistants, etc.) independent of underlying network technology, i.e. independent of location derivation technology and bearer as described in [MLS AD]. The MLP serves as the interface between a Location Server and a MLS Client. This specification defines the core set of operations that a Location Server should be able to perform.

## 3. Terminology and Conventions

### 3.1 Conventions

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

All sections and appendixes, except “Scope” and “Introduction” are normative, unless they are explicitly indicated to be informative.

#### Notational Conventions and Generic Grammar

The following rules are used throughout this specification to describe basic parsing constructs.

- ANSI X3.4-1986 defines the US-ASCII coded character set, see [ASCII]

|    |                                       |
|----|---------------------------------------|
| CR | = <US-ASCII CR, carriage return (13)> |
| LF | = <US-ASCII LF, linefeed (10)>        |
| SP | = <US-ASCII SP, space (32)>           |

- A set of characters enclosed in brackets [...] is a one-character expression that matches any of the characters in that set, e.g., "[lcs]" matches either an "l", "c", or "s". A range of characters is indicated with a dash, e.g., "[a-z]" matches any lower-case letter.
- The one-character expression can be followed by an interval operator, for example [a-zA-Z]{min,max} in which case the one-character expression is repeated at least min and at most max times, e.g., "[a-zA-Z]{2,4}" matches for example the strings "at", "Good", and "biG".

#### DTD Syntax Notation

The table below describes the special characters and separators used in the DTDs defining the different services.

| Character | Meaning                                       |
|-----------|---|
| +         | One or more occurrence                        |
| *         | Zero or more occurrences                      |
| ?         | Optional                                      |
| (...)     | A group of expressions to be matched together |
|           | OR...as in, "this or that"                    |
| ,         | Strictly ordered. Like an AND                 |

### 3.2 Definitions

|                        |  |
|------------------------|--|
| <b>Le</b>              | Reference point between MLS Client and Location Server. See also [23.271]  |
| <b>Location Server</b> | Software and/or hardware entity offering location capabilities.  |
| <b>Target</b>          | The entity being located.  |
| <b>Timing Advance</b>  | Parameter in GSM network used by the MS to advance its timings of transmissions to the Base Station so as to compensate for propagation delay. This parameter can also be used to estimate the distance between the MS and the Base Station. |

### 3.3 Abbreviations

|        |  |
|--------|--|
| A-GPS  | Assisted GPS   |
| AFLT   | Advanced Forward Link Triangulation positioning method     |
| ANSI   | American National Standards Institute                      |
| APN    | Access Point Name  |
| ASID   | Anonymous Subscriber Identity                              |
| ASP    | Application Service Provider                               |
| CRS    | Coordinate Reference System                                |
| DMSH   | Degrees Minutes Seconds Hemisphere                         |
| DTD    | Document Type Definition                                   |
| E-OTD  | Enhanced Observed Time Difference (E-OTD)                  |
| EFLT   | Enhanced Forward Link Triangulation positioning method     |
| ESRK   | Emergency Services Routing Key                             |

| XML    | Extensible Markup Language                                 |

## 4. Introduction

The Mobile Location Protocol (MLP) is an application-level protocol for getting the position of mobile stations (mobile phones, wireless personal digital assistants, etc.) independent of underlying network technology, i.e. independent of location derivation technology and bearer. The MLP serves as the interface between a Location Server and a MLS (Mobile Location Service) Client. This specification defines the core set of operations that a Location Server should be able to perform. The purpose of this specification is to specify the detailed technical specification of the interface between a Location Server and a MLS Client described in [MLS AD]. In the 3GPP context, this specification will be an instantiation of the detailed technical specifications for the Le reference point as defined in [23.271].

### 4.1 Version 3.0

MLP V3.0 do not exist as an OMA specification. However the specification LIF TS 101 V3.0.0 that was created by the OMA affiliate Location Interoperability Forum (LIF) is the baseline for the evolution of MLP.

### 4.2 Version 3.1

MLP V3.1 is the first version published by OMA. Relative LIF TS 101 V3.0.0 is includes bug fixes and editorial corrections but no added features.

### 4.3 Version 3.2

The main enhancement in MLP V3.2 is to align with the 3GPP Release 6 LCS Specification. One example of enhancement is introduction of Area Event trigger.

### 4.4 Version 3.3

The main enhancement in MLP V3.3 is to align with the 3GPP Release 7 LCS Specification and OMA SUPL 2.0. Examples of enhancements are historic location reporting, intermediate location reporting, support of civic location format and support of map data.

### 4.5 Version 3.4

The main enhancement in MLP V3.4 is to align with the 3GPP Release 10 LCS Specification, OMA SUPL 3.0 and OMA LPPe V1.0. Examples of enhancements are trigger pause resume, trigger query and velocity trigger.

## 5. Mobile Location Protocol

### 5.1 Overview

The Mobile Location Protocol (MLP) is an application-level protocol for querying the position of mobile stations independent of underlying network technology. The MLP serves as the interface between a Location Server and a location-based application (cf. Figure 1).

**Figure 1: MLP in the context of the LCS Architecture**

Possible realisations of a Location Server are the GMLC, which is the location server defined in GSM and UMTS, and the MPC, which is defined in ANSI standards. Since the location server should be seen as a logical entity, other implementations are possible.

In the scenarios (except where explicitly mentioned) an LCS client initiates the dialogue by sending a query to the location server and the server responds to the query.

#### 5.1.1 MLP structure

Different devices may support different means of communication. A ubiquitous protocol for location services should support different transport mechanisms.

**Figure 2: MLP Structure**

In MLP, the transport protocol is separated from the XML content. Figure 2 shows a layered view of MLP.

On the lowest level, the transport protocol defines how XML content is transported. Possible MLP transport protocols include HTTP, WSP, SOAP and others.

The Element Layer defines all common elements used by the services in the service layer. Currently MLP defines the following set of DTDs making up the element layer of MLP:

|                          |                                      |
|--------------------------|--------------------------------------|
| MLP.DTD                  | Element Definitions specific for MLP |
| MLP_ID_QOP_RES_SHAPE.DTD | Element Definitions common with RLP  |

The Service Layer defines the actual services offered by the MLP framework. Basic MLP Services are based on location services defined by 3GPP, and are defined by this specification. The "Advanced MLP Services" and "Other MLP Services" are additional services that either will be specified in other specifications or are specified by other fora that conform to the MLP framework.

**Note:** The boxes representing services in the Service Layer may contain more than one message. E.g. SLIS (Standard Location Immediate Service) consists of slir (Standard Location Immediate Request), slia (Standard Location Immediate Answer) and slirep (Standard Location Immediate Report) messages. Messages for each service are listed in the table below.

The Service Layer is divided into two sub-layers. The topmost defines the services mentioned in the previous paragraph. The lower sub-layer holds common elements, which are specific for that group of services. If an element is common to more than one group of services then that element is defined in the element layer. The present specification specifies no element sub-layer.

There are a number of different possible types of location services. Each implementation of location server can select which services it wants/needs to support. The services are described in the table below.

| Service                              | Description   |
|--------------------------------------|---|
| Standard Location Immediate Service  | <p>This is a standard query service with support for a large set of parameters. This service is used when a (single) location response is required immediately (within a set time) or the request may be served by several asynchronous location responses (until a predefined timeout limit is reached).</p> <p>This service consists of the following messages:</p> <ul style="list-style-type: none"> <li>- Standard Location Immediate Request</li> <li>- Standard Location Immediate Answer</li> <li>- Standard Location Immediate Report</li> </ul> |
| Emergency Location Immediate Service | <p>This is a service used especially for querying of the location of a mobile subscriber that has initiated an emergency call. The response to this service is required immediately (within a set time) or the request may be served by several asynchronous location responses.</p>  |

|                                      |   |
|--------------------------------------|---|
|                                      | <p>This service consists of the following messages:</p> <ul style="list-style-type: none"> <li>- Emergency Location Immediate Request</li> <li>- Emergency Location Immediate Answer</li> <li>- Emergency Location Immediate Report</li> </ul>  |
| Standard Location Reporting Service  | <p>This is a service that is used when a mobile subscriber wants an LCS Client to receive the MS location. The position is sent to the LCS Client from the location server. Which LCS application and its address are specified by the MS or defined in the location server.</p> <p>This service consists of the following message:</p> <ul style="list-style-type: none"> <li>- Standard Location Report</li> <li>- Standard Location Report Answer</li> </ul>   |
| Emergency Location Reporting Service | <p>This is a service that is used when the wireless network automatically initiates the positioning at an emergency call. The position and related data is then sent to the emergency application from the location server. Which LCS application and its address are defined in the location server.</p> <p>This service consists of the following message:</p> <ul style="list-style-type: none"> <li>- Emergency Location Report</li> </ul>  |
| Triggered Location Reporting Service | <p>This is a service used when the mobile subscriber's location should be reported at a specific time interval or on the occurrence of a specific event.</p> <p>This service consists of the following messages:</p> <ul style="list-style-type: none"> <li>- Triggered Location Reporting Request</li> <li>- Triggered Location Reporting Answer</li> <li>- Triggered Location Report</li> <li>- Triggered Location Reporting Stop Request</li> <li>- Triggered Location Reporting Stop Answer</li> <li>- Triggered Location Reporting Pause Report</li> <li>- Triggered Location Reporting Query Request</li> <li>- Triggered Location Reporting Query Answer</li> <li>- Triggered Location Query Report</li> </ul> |

## 5.1.2 MLP extension mechanism

The MLP specification has been designed with extensibility in mind. Examples of design principles employed to achieve this include:

- Separate DTDs for definitions that are common to all messages, e.g. client address and shapes, so they can be re-used.
- A message extension mechanism allowing the addition of new messages (specific for the HTTP mapping). This mechanism works by specifying an entity parameter, '%extension;', referring to an extension DTD. The extension DTD MUST contain another entity parameter, '%extension.message', containing the definition of the extension as a string together with the actual parameters being added
- A parameter extension mechanism allowing the addition of new parameters to existing messages. This mechanism works by specifying an entity parameter, '%extension;', referring to an extension DTD. The extension DTD MUST contain another entity parameter, '%extension.param', containing the definition of the extension as a string together with the actual messages being added.
- Each extension parameters SHOULD have a vendor specific prefix in order to guarantee their uniqueness.
- Element names defined in MLP SHALL NOT be reused with a different definition.

In order to use the extension, the extension DTD has to be explicitly referenced in the XML document.

The Location Server SHOULD ignore any extension that is not recognized and process the message as if the extension is not available.

**Example 1:** Message extension

```
<!-- truckco_MLP_extension -->

<!ENTITY % extension.message
               " | truckco_message">

<!ELEMENT truckco_message
               (truckco_data)>

<!ATTLIST truckco_message
               ver CDATA
               #FIXED "x.y.z">
```

```
<?xml version = "1.0" ?>
<!DOCTYPE svc_init SYSTEM "MLP_SVC_INIT_320.DTD" [
  <!ENTITY % extension SYSTEM
    "http://www.truckco.com/truckco_MLP_extension.dtd">
  %extension;
]>
<svc_init ver="3.4.0">
  <hdr ver="3.4.0">
    ...
  </hdr>
  <truckco_message ver="x.y.z">
    <truckco_data>
      ...
    </truckco_data>
  </truckco_message>
</svc_init>
```

**Example 2:** Parameter extension (note that “trucko\_codeword” is given with a vendor specific prefix as the element “codeword” has a different definition than in MLP)

```
<!-- truckco_MLP_extension -->

<!ENTITY % extension.param
               ", truckco_extension">

<!ELEMENT trucko_extension
               (truck_no, trucko_codeword)>
<!ELEMENT truck_no
               (#PCDATA)>
<!ELEMENT trucko_codeword
               (#PCDATA)>
<!ATTLIST trucko_codeword
               type ( long | short )
               #REQUIRED>
```

```
<?xml version = "1.0" ?>
<!DOCTYPE svc_init SYSTEM "MLP_SVC_INIT_320.DTD" [
  <!ENTITY % extension SYSTEM
    "http://www.truckco.com/truckco_MLP_extension.dtd">
  %extension;
]>
<svc_init ver="3.4.0">
  <hdr ver="3.4.0">
    ...
  </hdr>
  <slir ver="3.4.0">
    ...
    <truckco_extension>
      <truck_no>KLM4583</truck_no>
      <trucko_codeword type="short">6547</trucko_codeword>
    </truckco_extension>
  </slir>
</svc_init>
```

## 5.2 Mobile Location Service Definitions

### 5.2.1 Transport Protocol Layer Definitions

MLP can be implemented using various transport mechanism as stated in section 5.1.1. The following mappings are specified for MLP:

| Mapping | Section          |
|---------|------------------|
| HTTP    | 5.6 HTTP Mapping |

### 5.2.2 Element Layer Definitions

#### 5.2.2.1 Identity Element Definitions

```

### Examples of geo\_info encoding.

The encoding for WGS84 is:

```

<CoordinateReferenceSystem>
    <Identifier>
        <code>4326</code>
        <codeSpace>EPSG</codeSpace>
        <edition>6.1</edition>
    </Identifier>
</CoordinateReferenceSystem>

```

The encoding for the Transverse Mercator coordinate system based on the OSGB1936 is:

```

<CoordinateReferenceSystem>
    <Identifier>
        <code>27700</code>
        <codeSpace>EPSG</codeSpace>
        <edition>6.1</edition>
    </Identifier>
</CoordinateReferenceSystem>

```

Note that the GML V2.1.1 Implementation Specification is limited to use of only well-known CRSs, so this XML is currently abbreviated by a single attribute name and value:

srsName=<http://www.opengis.net/gml/srs/epsg.xml#4326>

Note also that GML uses crsName instead of srsName.

Note that GPS or A-GPS indicates no other GNSS is used or to be used. GNSS or A-GNSS indicates at least one GANSS or A-GANSS and may include GPS or A-GPS used or to be used.

### 5.2.3 Service Layer Definitions

Each message MAY have a header part and SHALL have a body part. The body part consists of the request/answer and is described in sections 5.2.3.2-5.2.3.8. The context or header part consists of the information that identifies the client as defined in section 5.2.3.1.

#### 5.2.3.1 Header Components

The **subclient** elements (if present) identify the ASPs, resellers and portals in the chain of service providers between the network and the end-user. The distinction between **client** and **subclient** elements is that the **client** element identifies the

provider of the service that the Location Server has the main relationship with, whereas the **subclient** elements identify the chain of other service providers up to the end-user. The final service provider in the chain is identified as such (`last_client="YES"`). The **requestor** indicates the initiator of the location request, so in this context besides an ASP it could also be an MS subscriber who is asking the position of another target MS. The identity of the **requestor** may be an MSISDN or any other identifier identifying the initiator of the location request.

The **serviceid** element can be present in **client**, **subclient** and **requestor** elements. If the Location Server supports **serviceid** element for privacy checking procedure it SHALL use the **serviceid** element received in the **client** element. The Location Server MAY check that all **serviceid** element received in a location request are consistent and MAY reject a request if not.

The **sessionid** element is used to represent the current session between the LCS Client and the Location Server. It MAY be used to replace the **id** and **pwd** elements, used in the context by the LCS Client to "login" to the Location Server, for the transactions that make up a session. For the first transaction of the session the LCS Client SHALL "login" as usual. The Location Server MAY optionally return the **sessionid** in the response to this first transaction. If the Location Server does not return a **sessionid** the LCS Client SHALL continue to "login" for subsequent transactions. The LCS Client MAY ignore the **sessionid** if desired and continue to "login" for subsequent transactions.

The Location Server will decide the policy to be used to determine how the **sessionid** will be created and maintained. For example, the Location Server may determine the session as being just the transactions pertaining to a single service/MSID combination – this being restrictive and hence secure whilst still being useable, or the Location Server may allow the session to apply to a number of transactions between the Location Server and LCS Client. The Location Server may also allow the **sessionid** to be used for a particular period of time. The Location Server may also decide to return a different **sessionid** on each response, which the LCS Client will then use on the next transaction of the session.

The **sessionid** cannot be used instead of the **req\_id** as this latter id refers to a set of reports that have been requested to be delivered from the Location Server to the LCS Client and do not form part of an existing LCS Client to Location Server connection. These reports are delivered by the Location Server "logging in" to the LCS Client for each delivery and the use of a **sessionid**, would allow the security of the LCS Client to be breached.

```

### **5.2.3.2 Standard Location Immediate Service**

This is a standard service for requesting the location of one or more Mobile Subscribers. The service is used when a single location response is required immediately (within a set time) or when several asynchronous location responses can be returned (until a predefined timeout limit is reached).

When a lot of positioning reports are requested, it may take an unacceptably long time to get all the responses from the network. If the Location Server supports it the LCS Client can define how to receive the location responses, either at the time of the response to the request, or individually using one or more connections initiated by the Location Server.

The extended service supports a number of different formats for describing the location of the mobile subscriber. It has also support for requesting a certain Quality of Service, Type of location and priority.

The service consists of the following messages:

- Standard Location Immediate Request
- Standard Location Immediate Answer
- Standard Location Immediate Report

The Standard Location Immediate Service SHALL consist of a Standard Location Immediate Request followed by one Standard Location Immediate Answer and zero, one or more OPTIONAL Standard Location Immediate Reports. Standard Location Immediate Reports can only be returned by Location Server if the attribute “res\_type” is set to “ASYNC” by the LCS Client.

The following message flow as depicted in Figure 3 encapsulates this service:

**Figure 3: Message Flow for the Standard Location Immediate Service**

Note: Multiple Standard Location Immediate Reports can occur when the location information for multiple targets was requested or the request allowed for an intermediate position and the results are reported back to the client in individual reports. An individual report may contain the result of one or more targets. It may also contain an intermediate position, not matching the requested QoP, but of increasing accuracy for each target.

#### 5.2.3.2.1 Standard Location Immediate Request DTD

### 5.2.3.3 Emergency Location Immediate Service

The emergency location immediate service is used to retrieve the position of a mobile subscriber that is involved in an emergency call or have initiated an emergency service in some other way.

When there is a chance that one location fix may block a location fix which takes a shorter time (eg A-GPS fix and a Cell-ID based fix) then if the Location Server supports it the LCS Client can define how to receive the location responses individually using one or more connections initiated by the Location Server.

The service consists of the following messages:

- Emergency Location Immediate Request
- Emergency Location Immediate Answer
- Emergency Location Immediate Report

The Emergency Location Immediate Service SHALL consist of a Emergency Location Immediate Request followed by one Emergency Location Immediate Answer and zero, one or more OPTIONAL Emergency Location Immediate Reports.

The following message flow as depicted in Figure 4 encapsulates this service:

**Figure 4: Message Flow for the Emergency Location Immediate Service**

Note: Multiple Emergency Location Immediate Reports can occur when the location information for multiple targets was requested or the request allowed for an intermediate position and the results are reported back to the client in individual reports. An individual report may contain the result of one or more targets. It may also contain an intermediate position, not matching the requested QoP, but of increasing accuracy for each target.

#### 5.2.3.4 Standard Location Reporting Service

When a mobile subscriber wants an LCS client to receive the MS location, e.g. by initiating a MO-LR procedure according to [23.271], a standard location report is generated. The LCS Client that the location report should be sent to SHALL be specified by the MS or defined within the Location Server.

The service consists of the following message:

- Standard Location Report
- Standard Location Report Answer

The Standard Location Reporting Service SHALL consist of one Standard Location Report followed by one Standard Location Report Answer.

The following message flow as depicted in Figure 5 encapsulates this service:

**Figure 5: Message flow for the Standard Location Reporting Service**

### 5.2.3.5 Emergency Location Reporting Service

If the wireless network initiates a positioning because a user initiates or releases an emergency call, an emergency location report is generated. The application(s) that the emergency location report should be sent to SHALL be defined within the location server. Data as required geographical format and address to application SHALL also be defined within the location server.

The service consists of the following message:

- Emergency Location Report

The Emergency Location Reporting Service SHALL consist one Emergency Location Report.

The following message flow as depicted in Figure 6 encapsulates this service:

**Figure 6: Message Flow for the Emergency Location Reporting Service**

</eme_pos>
</eme_event>
</emerep>

```

### 5.2.3.6 Triggered Location Reporting Service

The triggered location reporting service is used when an application wants the position of several MSs to be tracked. The triggers could be:

- The periodicity of reporting defined by an interval time
- An MS action, defined as the event "UE available" in 3GPP [23.271].
- A Change of Area, defined as the event "change of area" in 3GPP [23.271].
- An Velocity Event , defined as the event "Velocity Event" in [SUPL 3.0].
- A Distance Event, that is based on the the distances between the target MS and one or more reference objects.
- An Equidistance Event, that is based on the distance travelled from the last report.

The report will be triggered when one of the pre-defined MS's actions occurred or the time interval elapses. If reporting is based on an interval the reporting can be also be defioned to utilize quasirealtime and batch reporting modes. In quasirealtime mode, reports are not sent if the target has become unavailable but are instead sent at later time when location information has become available. In batch reporting modes the request includes a condition when reports shall be sent. The condition can be a number of measurement, a time expressed in minutes or when the service terminates.

The service consists of the following messages:

- Triggered Location Reporting Request
- Triggered Location Reporting Answer
- Triggered Location Report
- Triggered Location Reporting Stop Request
- Triggered Location Reporting Stop Answer
- Triggered Location Reporting Pause Report
- Triggered Location Reporting Query Request
- Triggered Location Reporting Query Answer
- Triggered Location Query Report

The Triggered Location Reporting Service SHALL consist of a Triggered Location Reporting Request followed by one Triggered Location Reporting Answer and zero, one or more OPTIONAL Triggered Location Reports. When it is assumed that only one location report is to be sent but it is unfeasible to include all information in one Triggered Location Report the information MAY be segmented into multiple Triggered Location Reports. The segmentation is indicated by a "more" attribute.

The Triggered Location Reporting Service MAY also include Triggered Location Reporting Stop Request that SHALL be followed by one Triggered Location Reporting Stop Answer. This Triggered Location Reporting Stop Request MAY allow stopping triggered location reporting for any individual target(s) included in the Triggered Location Reporting Request.

Additionally a Triggered Location Reporting Stop Answer MAY be sent without preceding Triggered Location Reporting Stop Request.

The Triggered Location Reporting Service MAY also include one or more Triggered Location Reporting Pause Report. This message informs the LCS Client that the reporting has been paused or resumed.

The Triggered Location Reporting Service MAY also include a Triggered Location Reporting Query Request that SHALL be followed by one Triggered Location Reporting Query Answer and one or more Triggered Location Query Reports. This Triggered Location Reporting Query Request MAY allow the LCS Client to query the Location Server for reporting of all still active trigger requests related to the LCS Client.

The following message flow as depicted in Figure 7 encapsulates this service:

**Figure 7: Message Flow for the Triggered Location Reporting Service**

**Note:**

If the network unilaterally decides to terminate the location reporting, the stop reporting information SHALL be carried in a tlrep.

The cancellation of triggered location reporting request could be initiated by the Location Server itself for some reasons such as privacy profile update. In this case a tlrsa MAY be sent without a preceding tlrsr.

### 5.2.3.6.1 Triggered Location Reporting Request DTD

```
<!-- MLP_TLRR -->

   service_coverage?, MapRequest? %extension.param;)>

<!ATTLIST tlrr
  ver CDATA
    #FIXED "3.4.0">
```

The following rules apply to the use of ‘start\_time’, ‘stop\_time’, ‘interval’ , ‘duration’ , ‘tlrr\_event’ and ‘loc\_type’:

- TLRR with ‘interval’ SHALL be interpreted as a request for periodic location reports, and TLRR with ‘tlrr\_event’ SHALL be interpreted as a request for a location report on the occurrence of a specific event. ‘interval’ and ‘tlrr\_event’ MAY be combined for combined periodic and event based location request. When neither ‘interval’ nor ‘tlrr\_event’ is specified in TLRR, the Location Server MUST reject the request with an error indication ‘106’ to the client.
- If no START\_TIME is specified reporting SHALL start immediately.
- If no STOP\_TIME is specified the reporting SHOULD occur until explicitly canceled with ‘Triggered Location Stop Request’ or a time out occurs (depending on system configuration). Timeout MAY be reported to the LCS client by ‘time\_remaining’ in triggered location report.
- If STOP\_TIME and Duration are both presented in one request, the Location Server MUST reject the request with an error indication ‘110’ to the client.
- If START\_TIME is ‘older’ than the current time then the Location Server MUST reject the request with an error indication ‘110’ to the client.
- If STOP\_TIME is ‘older’ than the current time then the Location Server MUST reject the request with an error indication ‘110’ to the client.
- If STOP\_TIME is earlier than START\_TIME then the implementation MUST reject the request with an error indication ‘110’ to the client.
- If STOP\_TIME is equal to START\_TIME then the Location Server MUST return a single location report to the client at the specified time. Any interval specified MUST be ignored.
- If Duration is specified as zero the Location Server MUST return a single location report to the client at the specified time. Any interval specified MUST be ignored.

- If Loc\_type is specified as LAST the Location Server MUST evaluate the trigger criteria based on stored location information.

The (optional) parameter 'service\_coverage' is only allowed for plain periodic requests, i.e. not for event-related requests like MS\_Available triggers or area triggers.

**Example 1:** TLRR for periodic location reports during a period specified by 'start\_time' and 'stop\_time'

```
<tlrr ver="3.4.0">
<msids>
  <msid>461011678298</msid>
</msids>

        <msid>461011678301</msid>
    </trigger_data>
</tlqrep>
```

### 5.2.3.7 General Error Message Definition

When an LCS client attempts to invoke a service not defined in this specification, the location server SHOULD return a General Error Message. Sending a general error message (GEM) is no proper solution by itself because it can not always be expected that the client will understand this (MLP) response message, since - by sending an invalid request - the client shows that it may not be familiar with the proper set of MLP services. So additional error indications MAY be described in the appropriate transport layer mappings.

```
<!-- MLP_GEM -->

  <add_info>
    The server does not support a service named 'skir'
  </add_info>
</gem>

```

### 5.2.3.8 Historic Location Immediate Service

This is a service for requesting reporting of historic locations of one Mobile Subscriber.

When a large number of locations are to be reported, it may take an unacceptably long time before a response can be sent to the LCS Client. The LCS Client can thus indicate it allows the Location Server to send the location responses, either at the time of the response to the request, or individually using one or more connections initiated by the Location Server.

The service consists of the following messages:

- Historic Location Immediate Request
- Historic Location Immediate Answer
- Historic Location Immediate Report

The Historic Location Immediate Service SHALL consist of a Historic Location Immediate Request followed by one Historic Location Immediate Answer and zero, one or more OPTIONAL Historic Location Immediate Reports.

The following message flow as depicted in Figure 8 encapsulates this service:

**Figure 8: Message Flow for the Historic Location Immediate Service**

#### 5.2.3.8.1 Historic Location Immediate Request DTD

## 5.3 Elements and attributes in DTD

### 5.3.1 add\_info

|                        |   |
|------------------------|---|
| <b>Description:</b>    | A text string containing additional information about a certain result. |
| <b>Type:</b>           | Element   |
| <b>Format:</b>         | Char string   |
| <b>Defined values:</b> |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>        | <add_info>EVENT</add_info>  |
| <b>Note:</b>           |   |

### 5.3.2 alt

|                        |   |
|------------------------|---|
| <b>Description:</b>    | The altitude of the MS in meters in respect of the ellipsoid which is used to be define the coordinates |
| <b>Type:</b>           | Element   |
| <b>Format:</b>         | Char String   |
| <b>Defined values:</b> | [+ -]?[0-9]+  |
| <b>Default value:</b>  |   |
| <b>Example:</b>        | <alt>1200</alt>   |
| <b>Note:</b>           | This element is present if altitude is possible to attain by the used positioning method.               |

### 5.3.3 alt\_acc

|                        |  |
|------------------------|--|
| <b>Description:</b>    | Accuracy of requested altitude in meters |
| <b>Type:</b>           | Element                                  |
| <b>Format:</b>         | Char String                              |
| <b>Defined values:</b> | [0-9]+                                   |
| <b>Default value:</b>  |  |
| <b>Example:</b>        | <alt_acc>200</alt_acc>                   |
| <b>Note:</b>           |  |

#### 5.3.3.1 qos\_class

|                        |  |   |
|------------------------|--|---|
| <b>Description:</b>    | defines the degree of adherence by the Location Service to the quality of another quality of service parameter. In the MLP context this refers to the XML “parent” element, i.e alt_acc, hoc_acc, or ll_acc, resp. |   |
| <b>Type:</b>           | Attribute  |   |
| <b>Format:</b>         | Char string  |   |
| <b>Defined values:</b> | ASSURED  | defines the most stringent requirement on the accuracy achieved for a location request. If a location estimate obtained does not fulfil the ‘alt_acc’ |

|                       |             |   |
|-----------------------|-------------|---|
|                       |             | requirements, then it shall be discarded and an appropriate error cause sent.   |
|                       | BEST_EFFORT | defines the least stringent requirement on the QoS achieved for a location request. If a location estimate obtained does not fulfil the other QoS requirements, it should still be returned but with an appropriate indication that the requested QoS was not met. If no location estimate is obtained, an appropriate error cause is sent. |
| <b>Default value:</b> |             |   |
| <b>Example:</b>       |             | <alt_acc qos_class="BEST_EFFORT">200</alt_acc>  |
| <b>Note:</b>          |             | For details see 3GPP TS 23.271, v6.8.0, clause 6.5.1  |

### 5.3.4 alt\_unc

|  |                        |
|--|------------------------|
| <b>Description:</b>                        |                        |
| Uncertainty of altitude estimate in meters |                        |
| <b>Type:</b>                               | Element                |
| <b>Format:</b>                             | Char String            |
| <b>Defined values:</b>                     | [0-9]+                 |
| <b>Default value:</b>                      |                        |
| <b>Example:</b>                            | <alt_unc>200</alt_unc> |
| <b>Note:</b>                               |                        |

### 5.3.5 angle

|  |                      |
|--|----------------------|
| <b>Description:</b>  |                      |
| Specifies the angle (in angularUnit) of rotation of an ellipse measured clockwise from north |                      |
| <b>Type:</b>   | Element              |
| <b>Format:</b>   | Char String          |
| <b>Defined values:</b>   |                      |
| <b>Default value:</b>  |                      |
| <b>Example:</b>  | <angle>24.30</angle> |
| <b>Note:</b>   |                      |

## 5.3.6 angularUnit

|   |                                    |
|---|------------------------------------|
| <b>Description:</b>   |                                    |
| The angularUnit defines the unit for any angular value used in the shape description. For example the startAngle value in the CircularArcArea will be defined by this unit. If this unit is not included in a shape definition the angular unit defined in the CRS SHALL be used. |                                    |
| <b>Type:</b>  | Element                            |
| <b>Format:</b>  | Char String                        |
| <b>Defined values:</b>  | Degrees<br>Radians                 |
| <b>Default value:</b>   | Degrees                            |
| <b>Example:</b>   | <angularUnit>Degrees</angularUnit> |
| <b>Note:</b>  |                                    |

## 5.3.7 Applicationid

|  |   |
|--|---|
| <b>Description:</b>  |   |
| This element contains the application information for the incoming request |   |
| <b>Type:</b>   | Element   |
| <b>Format:</b>   |   |
| <b>Defined values:</b>   |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>  | <applicationid appProvider="TheAppProvider" appName="Fleet Tracker" appVersion="3.1.2" /> |
| <b>Note:</b>   |   |

### 5.3.7.1 appProvider

|   |                           |
|---|---------------------------|
| <b>Description:</b>                                   |                           |
| This attribute contains the application provider name |                           |
| <b>Type:</b>  | Attribute                 |
| <b>Format:</b>  | Char String               |
| <b>Defined values:</b>                                | 1 – 24 characters         |
| <b>Default value:</b>                                 |                           |
| <b>Example:</b>                                       | See applicationid element |
| <b>Note:</b>  |                           |

### 5.3.7.2 appName

|  |                           |
|--|---------------------------|
| <b>Description:</b>                          |                           |
| This attribute contains the application name |                           |
| <b>Type:</b>                                 | Attribute                 |
| <b>Format:</b>                               | Char String               |
| <b>Defined values:</b>                       | 1 – 32 characters         |
| <b>Default value:</b>                        |                           |
| <b>Example:</b>                              | See applicationid element |

|       |  |
|-------|--|
| Note: |  |
|-------|--|

### 5.3.7.3 appVersion

|  |                           |
|--|---------------------------|
| <b>Description:</b>                                    |                           |
| This attribute contains the version of the application |                           |
| <b>Type:</b>   | Attribute                 |
| <b>Format:</b>   | Char String               |
| <b>Defined values:</b>                                 | 1 – 8 characters          |
| <b>Default value:</b>                                  |                           |
| <b>Example:</b>  | See applicationid element |
| <b>Note:</b>   |                           |

### 5.3.8 Base64Map

|   |  |
|---|--|
| <b>Description:</b>                               |  |
| This element contains the content of a map image. |  |
| <b>Type:</b>                                      | Element  |
| <b>Format:</b>                                    | Char String  |
| <b>Defined values:</b>                            |  |
| <b>Default value:</b>                             |  |
| <b>Example:</b>                                   | <Base64Map>iVBORwAANSUhEUG II=</Base64Map>                 |
| <b>Note:</b>                                      | The map image data is encoded as “based 64 encoded string” |

### 5.3.9 batch\_cond

|   |  |
|---|--|
| <b>Description:</b>                                   |  |
| Defines the condition when to execute batch reporting |  |
| <b>Type:</b>  | Element  |
| <b>Format:</b>  | Char String  |
| <b>Defined values:</b>                                | 1 – 1024 if type is measurements, 1 – 2048 if type is minutes. |
| <b>Default value:</b>                                 | -  |
| <b>Example:</b>                                       | <batch_cond batch_type= "MEASUREMENTS" > 500 </batch_cond>     |
| <b>Note:</b>  |  |

#### 5.3.9.1 batch\_type

|                                      |  |              |  |         |   |              |   |
|--------------------------------------|--|--------------|--|---------|---|--------------|---|
| <b>Description:</b>                  |  |              |  |         |   |              |   |
| Defines the type of batch condition. |  |              |  |         |   |              |   |
| <b>Type:</b>                         | Attribute  |              |  |         |   |              |   |
| <b>Format:</b>                       | Char string  |              |  |         |   |              |   |
| <b>Defined values:</b>               | <table> <tr> <td>MEASUREMENTS</td> <td>Location reports shall be sent when specified number of measurements have executed</td> </tr> <tr> <td>MINUTES</td> <td>Location reports shall be sent when specified number minutes has elapsed.</td> </tr> <tr> <td>ENDOFSERVICE</td> <td>Location report shall be sent when service terminates. Any value in</td> </tr> </table> | MEASUREMENTS | Location reports shall be sent when specified number of measurements have executed | MINUTES | Location reports shall be sent when specified number minutes has elapsed. | ENDOFSERVICE | Location report shall be sent when service terminates. Any value in |
| MEASUREMENTS                         | Location reports shall be sent when specified number of measurements have executed   |              |  |         |   |              |   |
| MINUTES                              | Location reports shall be sent when specified number minutes has elapsed.  |              |  |         |   |              |   |
| ENDOFSERVICE                         | Location report shall be sent when service terminates. Any value in  |              |  |         |   |              |   |

|                       |  |
|-----------------------|--|
|                       | element batch_cond is disregarded                        |
| <b>Default value:</b> | CURRENT  |
| <b>Example:</b>       | <batch_cond batch_type="MEASUREMENTS"> 500 </batch_cond> |
| <b>Note:</b>          |  |

### 5.3.10 Box

|   |  |
|---|--|
| <b>Description:</b>                       |  |
| The Box element is used to encode extents |  |
| <b>Type:</b>                              | Element  |
| <b>Format:</b>                            |  |
| <b>Defined values:</b>                    |  |
| <b>Default value:</b>                     |  |
| <b>Example:</b>                           | <pre>&lt;Box srsName="www.epsg.org#4326" gid="some_thing"&gt;   &lt;coord&gt;     &lt;X&gt;30 27 45.3N&lt;/X&gt;     &lt;Y&gt;45 25 52.9E&lt;/Y&gt;   &lt;/coord&gt;   &lt;coord&gt;     &lt;X&gt;31 27 45.3N&lt;/X&gt;     &lt;Y&gt;46 25 52.9E&lt;/Y&gt;   &lt;/coord&gt; &lt;/Box&gt;</pre> |
| <b>Note:</b>                              |  |

#### 5.3.10.1 gid

|   |   |
|---|---|
| <b>Description:</b>   |   |
| The gid is of XML attribute type ID and is used for references to elements within a single XML document. It allows XML technologies such as XPointer and xref to be used. |   |
| <b>Type:</b>  | Attribute   |
| <b>Format:</b>  | Char String   |
| <b>Defined values:</b>  |   |
| <b>Default value:</b>   |   |
| <b>Example:</b>   | <Box srsName="www.epsg.org#4326" gid="some_thing">      |
| <b>Note:</b>  | This attribute is optional and is on all shape elements |

#### 5.3.10.2 srsName

|  |  |
|--|--|
| <b>Description:</b>  |  |
| srsName is a short hand method of defining the CoordinateReferenceSystem. It is a URI datatype that contains the codeSpace and code values, which are defined in the same way as in the CoordinateReferenceSystem. |  |
| <b>Type:</b>   | Attribute  |
| <b>Format:</b>   | Char String  |
| <b>Defined values:</b>   |  |
| <b>Default value:</b>  | <a href="http://www.epsg.org/#4326">www.epsg.org/#4326</a>   |
| <b>Example:</b>  | <Box srsName="www.epsg.org/#4326">   |
| <b>Note:</b>   | This attribute is optional and is on all shape elements. If the srsName is not included the WGS84 CRS SHOULD be assumed. |

### 5.3.11 cc

|                             |                                 |
|-----------------------------|---------------------------------|
| <b>Description:</b>         |                                 |
| Specifies the country code. |                                 |
| <b>Type:</b>                | Element                         |
| <b>Format:</b>              | Char String                     |
| <b>Defined values:</b>      | 1-3 digits e.g. 355 for Albania |
| <b>Default value:</b>       |                                 |
| <b>Example:</b>             | <cc>355</cc>                    |
| <b>Note:</b>                |                                 |

### 5.3.12 cellid

|                              |                      |
|------------------------------|----------------------|
| <b>Description:</b>          |                      |
| Identifies the Cell Identity |                      |
| <b>Type:</b>                 | Element              |
| <b>Format:</b>               | Char String          |
| <b>Defined values:</b>       | 0-65535              |
| <b>Default value:</b>        |                      |
| <b>Example:</b>              | <cellid>546</cellid> |
| <b>Note:</b>                 |                      |

### 5.3.13 change\_area

|  |  |
|--|--|
| <b>Description:</b>  |  |
| Specifies the event that initiated the positioning of the MS |  |
| <b>Type:</b>   | Element  |
| <b>Format:</b>   |  |
| <b>Defined values:</b>                                       |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>  | <pre>&lt;change_area type="MS_ENTERING"&gt;     &lt;target_area&gt;         &lt;name_area&gt;Seoul&lt;/name_area&gt;     &lt;/target_area&gt; &lt;/change_area&gt;</pre> |
| <b>Note:</b>   |  |

#### 5.3.13.1 type

|  |                |
|--|----------------|
| <b>Description:</b>  |                |
| Specifies the trigger that initiated the positioning of the MS |                |
| <b>Type:</b>   | Attribute      |
| <b>Format:</b>   | Char string    |
| <b>Defined values:</b>   | MS_ENTERING    |
|  | MS_LEAVEING    |
|  | MS_WITHIN_AREA |

|                       |                                  |
|-----------------------|----------------------------------|
|                       | MS_OUTSIDE_AREA                  |
| <b>Default value:</b> |                                  |
| <b>Example:</b>       | <change_area type="MS_ENTERING"> |
| <b>Note:</b>          |                                  |

### 5.3.13.2 loc\_estimates

|   |                                    |
|---|------------------------------------|
| <b>Description:</b>                                     |                                    |
| Specifies whether location estimates is required or not |                                    |
| <b>Type:</b>  | Attribute                          |
| <b>Format:</b>  | Char string                        |
| <b>Defined values:</b>                                  | TRUE                               |
|   | FALSE                              |
| <b>Default value:</b>                                   |                                    |
| <b>Example:</b>   | <change_area loc_estimates="TRUE"> |
| <b>Note:</b>  |                                    |

## 5.3.14 CircularArcArea

|  |   |
|--|---|
| <b>Description:</b>  |   |
| An arc is defined by a point of origin with one offset angle and one uncertainty angle plus one inner radius and one uncertainty radius. |   |
| <b>Type:</b>   | Element   |
| <b>Format:</b>   |   |
| <b>Defined values:</b>   |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>  | <pre>&lt;CircularArcArea srsName="www.epsg.org#4326" gid="some_thing"&gt;   &lt;coord&gt;     &lt;X&gt;30 27 45.3N&lt;/X&gt;     &lt;Y&gt;45 25 52.9E&lt;/Y&gt;   &lt;/coord&gt;   &lt;inRadius&gt;280&lt;/inRadius&gt;   &lt;outRadius&gt;360&lt;/outRadius&gt;   &lt;startAngle&gt;5&lt;/startAngle&gt;   &lt;stopAngle&gt;240&lt;/stopAngle&gt; &lt;/CircularArcArea&gt;</pre> |
| <b>Note:</b>   |   |

### 5.3.14.1 gid

See section 5.3.10.1.

### 5.3.14.2 srsName

See section 5.3.10.2.

## 5.3.15 CircularArea

|   |  |
|---|--|
| <b>Description:</b>   |  |
| The set of points on the ellipsoid, which are at a distance from the point of origin less than or equal to "r". |  |

|                        |   |
|------------------------|---|
| <b>Type:</b>           | Element   |
| <b>Format:</b>         |   |
| <b>Defined values:</b> |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>        | <pre>&lt;CircularArea srsName="www.epsg.org#4326" gid="some_thing"&gt; &lt;coord&gt; &lt;X&gt;30 27 45.3N &lt;/X&gt; &lt;Y&gt;45 25 52.9E&lt;/Y&gt; &lt;/coord&gt; &lt;radius&gt;240&lt;/radius&gt; &lt;/CircularArea&gt;</pre> |
| <b>Note:</b>           |   |

### 5.3.15.1 gid

See section 5.3.10.1.

### 5.3.15.2 srsName

See section 5.3.10.2.

## 5.3.16 civicloc\_element

|  |  |
|--|--|
| <b>Description:</b>  |  |
| Specifies one element in a civic location. A civic location (civicloc) consists of one or more civicloc_element. |  |
| <b>Type:</b>   | Element  |
| <b>Format:</b>   | Char string  |
| <b>Defined values:</b>   |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>  | <civicloc_element element_type="COUNTRY">US</civicloc_element> |
| <b>Note:</b>   |  |

### 5.3.16.1 element\_type

|   |  |
|---|--|
| <b>Description:</b>   |  |
| Specifies the type of element an civicloc_element contains. |  |
| <b>Type:</b>  | Attribute  |
| <b>Format:</b>  | Char string  |
| <b>Defined values:</b>                                      | As defined in [RFC 4119] and [RFC 5139]                        |
| <b>Default value:</b>                                       |  |
| <b>Example:</b>   | <civicloc_element element_type="COUNTRY">US</civicloc_element> |

## 5.3.17 code

|  |             |
|--|-------------|
| <b>Description:</b>  |             |
| This is the unique identifier for the Coordinate ReferenceSystem as used by the authority cited in codeSpace |             |
| <b>Type:</b>   | Element     |
| <b>Format:</b>   | Char String |
| <b>Defined values:</b>   |             |

|                       |                   |
|-----------------------|-------------------|
| <b>Default value:</b> |                   |
| <b>Example:</b>       | <code>4326</code> |
| <b>Note:</b>          |                   |

### 5.3.18 codeSpace

|  |                             |
|--|-----------------------------|
| <b>Description:</b>  |                             |
| The codeSpace is the authority, which is responsible for the definition of the coordinate reference systems. |                             |
| <b>Type:</b>   | Element                     |
| <b>Format:</b>   | Char String                 |
| <b>Defined values:</b>   |                             |
| <b>Default value:</b>  | www.epsg.org/...            |
| <b>Example:</b>  | <codeSpace>EPSG</codeSpace> |
| <b>Note:</b>   |                             |

### 5.3.19 codeword

|  |   |
|--|---|
| <b>Description:</b>  |   |
| Codeword is an access code defined per MS, used to protect location information of MS against unwanted location request. Only location requests with the correct codeword of a target MS are accepted. |   |
| <b>Type:</b>   | Element   |
| <b>Format:</b>   | Char String   |
| <b>Defined values:</b>   |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>  | <codeword>0918a7cb</codeword>   |
| <b>Note:</b>   | An error SHALL be returned if the number of codewords is not equal to the number of msids in an msid_range. |

### 5.3.20 Confidence

|  |                               |
|--|-------------------------------|
| <b>Description:</b>  |                               |
| This element represents the confidence of a motionstate or a set of motionstates. The use and values are defined in LPPe [LPPe]. |                               |
| <b>Type:</b>   | Element                       |
| <b>Format:</b>   | Char string                   |
| <b>Defined values:</b>   |                               |
| <b>Default value:</b>  |                               |
| <b>Example:</b>  | <Confidence> 75 </Confidence> |
| <b>Note:</b>   |                               |

### 5.3.21 direction

|   |             |
|---|-------------|
| <b>Description:</b>   |             |
| Specifies the direction of movement (in degrees) of a positioned MS |             |
| <b>Type:</b>  | Element     |
| <b>Format:</b>  | Char String |

|                        |  |
|------------------------|--|
| <b>Defined values:</b> | 0-360  |
| <b>Default value:</b>  |  |
| <b>Example:</b>        | <direction>120</direction>   |
| <b>Note:</b>           | This element is present if direction is possible to attain by the used positioning method. |

### 5.3.22 distance\_event

|                        |   |
|------------------------|---|
| <b>Description:</b>    |   |
|                        | Specifies a distance event in triggered location reporting service  |
| <b>Type:</b>           | Element   |
| <b>Format:</b>         |   |
| <b>Defined values:</b> |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>        | <pre>&lt;distance_event type="ABOVE"&gt; &lt;reference_object&gt;   &lt;msid&gt;461011678298&lt;/msid&gt; &lt;/reference_object&gt; &lt;/distance_event&gt;</pre> |
| <b>Note:</b>           |   |

#### 5.3.22.1 type

|                        |   |                   |   |                  |   |                 |  |                  |  |
|------------------------|---|-------------------|---|------------------|---|-----------------|--|------------------|--|
| <b>Description:</b>    |   |                   |   |                  |   |                 |  |                  |  |
|                        | Specifies the trigger criteria that will initiate reporting of the MS. Reporting will be initiated when any of the distances between target MS and reference object fulfills the criteria.  |                   |   |                  |   |                 |  |                  |  |
| <b>Type:</b>           | Attribute   |                   |   |                  |   |                 |  |                  |  |
| <b>Format:</b>         | Char string   |                   |   |                  |   |                 |  |                  |  |
| <b>Defined values:</b> | <table border="1"> <tr> <td>ENTERING_DISTANCE</td> <td>Reporting performed each time the distance decreases below the target distance provided the minimum time between reports has elapsed. When the trigger is initiated it is assumed that the distance is above the target distance.</td> </tr> <tr> <td>LEAVING_DISTANCE</td> <td>Reporting performed each time the distance increases above the target distance provided the minimum time between reports has elapsed. When the trigger is initiated it is assumed that the distance is below the target distance.</td> </tr> <tr> <td>WITHIN_DISTANCE</td> <td>Reporting performed when distance is below the target distance provided the minimum time between reports has elapsed .</td> </tr> <tr> <td>OUTSIDE_DISTANCE</td> <td>Reporting performed when distance is above the target distance provided the minimum time between reports has elapsed .</td> </tr> </table> | ENTERING_DISTANCE | Reporting performed each time the distance decreases below the target distance provided the minimum time between reports has elapsed. When the trigger is initiated it is assumed that the distance is above the target distance. | LEAVING_DISTANCE | Reporting performed each time the distance increases above the target distance provided the minimum time between reports has elapsed. When the trigger is initiated it is assumed that the distance is below the target distance. | WITHIN_DISTANCE | Reporting performed when distance is below the target distance provided the minimum time between reports has elapsed . | OUTSIDE_DISTANCE | Reporting performed when distance is above the target distance provided the minimum time between reports has elapsed . |
| ENTERING_DISTANCE      | Reporting performed each time the distance decreases below the target distance provided the minimum time between reports has elapsed. When the trigger is initiated it is assumed that the distance is above the target distance.   |                   |   |                  |   |                 |  |                  |  |
| LEAVING_DISTANCE       | Reporting performed each time the distance increases above the target distance provided the minimum time between reports has elapsed. When the trigger is initiated it is assumed that the distance is below the target distance.   |                   |   |                  |   |                 |  |                  |  |
| WITHIN_DISTANCE        | Reporting performed when distance is below the target distance provided the minimum time between reports has elapsed .  |                   |   |                  |   |                 |  |                  |  |
| OUTSIDE_DISTANCE       | Reporting performed when distance is above the target distance provided the minimum time between reports has elapsed .  |                   |   |                  |   |                 |  |                  |  |
| <b>Default value:</b>  |   |                   |   |                  |   |                 |  |                  |  |
| <b>Example:</b>        | <distance_event type=" WITHIN_DISTANCE">  |                   |   |                  |   |                 |  |                  |  |
| <b>Note:</b>           |   |                   |   |                  |   |                 |  |                  |  |

#### 5.3.22.2 loc\_estimates

See section 5.3.13.2.

### 5.3.23 distanceUnit

| <b>Description:</b>   |   |
|---|---|
| The distanceUnit defines the linear unit for any distance used in the shape description. For example the radius value in the CircularArea will be defined by this unit. If this unit is not included in a shape definition the distance unit defined in the CRS SHOULD be used. |   |
| <b>Type:</b>  | Element                                 |
| <b>Format:</b>  | Char String                             |
| <b>Defined values:</b>  |   |
| <b>Default value:</b>   | meter                                   |
| <b>Example:</b>   | <distanceUnit>surveyfoot</distanceUnit> |
| <b>Note:</b>  | values are defined by the CRS authority |

### 5.3.24 duration

| <b>Description:</b>   |   |        |             |    |     |    |       |    |         |    |         |
|---|---|--------|-------------|----|-----|----|-------|----|---------|----|---------|
| A string defining the time range of triggered location reporting service. |   |        |             |    |     |    |       |    |         |    |         |
| <b>Type:</b>  | Element   |        |             |    |     |    |       |    |         |    |         |
| <b>Format:</b>  | Char String<br><br>The time is expressed as ddhhmmss where:<br><table border="1"><tr><td>String</td><td>Description</td></tr><tr><td>dd</td><td>Day</td></tr><tr><td>hh</td><td>Hours</td></tr><tr><td>mm</td><td>Minutes</td></tr><tr><td>ss</td><td>Seconds</td></tr></table> | String | Description | dd | Day | hh | Hours | mm | Minutes | ss | Seconds |
| String  | Description   |        |             |    |     |    |       |    |         |    |         |
| dd  | Day   |        |             |    |     |    |       |    |         |    |         |
| hh  | Hours   |        |             |    |     |    |       |    |         |    |         |
| mm  | Minutes   |        |             |    |     |    |       |    |         |    |         |
| ss  | Seconds   |        |             |    |     |    |       |    |         |    |         |
| <b>Defined values:</b>  |   |        |             |    |     |    |       |    |         |    |         |
| <b>Default value:</b>   |   |        |             |    |     |    |       |    |         |    |         |
| <b>Example:</b>   | <duration>00001000</duration>   |        |             |    |     |    |       |    |         |    |         |
| <b>Note:</b>  |   |        |             |    |     |    |       |    |         |    |         |

### 5.3.25 edition

| <b>Description:</b>   |                        |
|---|------------------------|
| The edition defines which version of the CRS database defined by the codeSpace authority is used. |                        |
| <b>Type:</b>  | Element                |
| <b>Format:</b>  | Char String            |
| <b>Defined values:</b>  |                        |
| <b>Default value:</b>   |                        |
| <b>Example:</b>   | <edition>6.0</edition> |
| <b>Note:</b>  |                        |

### 5.3.26 EllipticalArea

| <b>Description:</b>   |  |
|---|--|
| A set of points on the ellipsoid, which fall within or on the boundary of an ellipse. This ellipse has a semi-major axis of length r1 oriented at angle A (0 to 180°) measured clockwise from north and a semi-minor axis of length r2. |  |

|                        |   |
|------------------------|---|
| <b>Type:</b>           | Element   |
| <b>Format:</b>         |   |
| <b>Defined values:</b> |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>        | <pre>&lt;EllipticalArea srsName="www.epsg.org#4326" gid="some_thing"&gt; &lt;coord&gt;   &lt;X&gt;30 27 45.3N&lt;/X&gt;   &lt;Y&gt;45 25 52.9E&lt;/Y&gt; &lt;/coord&gt; &lt;angle&gt;240&lt;/angle&gt; &lt;semiMajor&gt;275&lt;/semiMajor&gt; &lt;semiMinor&gt;150&lt;/semiMinor&gt; &lt;angularUnit&gt;degrees&lt;/angularUnit&gt; &lt;/EllipticalArea&gt;</pre> |
| <b>Note:</b>           |   |

### 5.3.26.1 gid

See section 5.3.10.1.

### 5.3.26.2 srsName

See section 5.3.10.2.

## 5.3.27 eme\_event

|   |                                   |
|---|-----------------------------------|
| <b>Description:</b>   |                                   |
| Specifies the events that initiated the positioning of the MS at an emergency call. |                                   |
| <b>Type:</b>  | Element                           |
| <b>Format:</b>  |                                   |
| <b>Defined values:</b>  |                                   |
| <b>Default value:</b>   |                                   |
| <b>Example:</b>   | <eme_event eme_trigger="EME_ORG"> |
| <b>Note:</b>  |                                   |

### 5.3.27.1 eme\_trigger

|  |  |         |  |         |  |
|--|--|---------|--|---------|--|
| <b>Description:</b>  |  |         |  |         |  |
| Specifies the trigger that initiated the positioning of the MS at an emergency call. |  |         |  |         |  |
| <b>Type:</b>   | Attribute  |         |  |         |  |
| <b>Format:</b>   | Char string  |         |  |         |  |
| <b>Defined values:</b>   | <table> <tr> <td>EME_ORG</td> <td>An emergency service user originated an emergency call</td> </tr> <tr> <td>EME_REL</td> <td>An emergency service user released an emergency call</td> </tr> </table> | EME_ORG | An emergency service user originated an emergency call | EME_REL | An emergency service user released an emergency call |
| EME_ORG  | An emergency service user originated an emergency call   |         |  |         |  |
| EME_REL  | An emergency service user released an emergency call   |         |  |         |  |
| <b>Default value:</b>  |  |         |  |         |  |
| <b>Example:</b>  | <eme_event eme_trigger="EME_ORG">  |         |  |         |  |
| <b>Note:</b>   |  |         |  |         |  |

### 5.3.28 eme\_pos

|   |  |
|---|--|
| <b>Description:</b>   |  |
| Specifies the position of the MS in an emergency location service response. |  |
| <b>Type:</b>  | Element  |
| <b>Format:</b>  |  |
| <b>Defined values:</b>  |  |
| <b>Default value:</b>   |  |
| <b>Example:</b>   | <pre>&lt;eme_pos pos_method="A-GPS"&gt;   &lt;msid&gt;4711&lt;/msid&gt;   &lt;poserr&gt;     &lt;result resid="1"&gt;SYSTEM FAILURE&lt;/result&gt;     &lt;time utc_off="0200"&gt;20040617144558&lt;/time&gt;   &lt;/poserr&gt; &lt;/eme_pos&gt;</pre> |
| <b>Note:</b>  |  |

#### 5.3.28.1 pos\_method

|  |   |   |
|--|---|---|
| <b>Description:</b>  |   |   |
| Specifies the positioning method used to obtain the associated location estimate |   |   |
| <b>Type:</b>   | Attribute   |   |
| <b>Format:</b>   | Char string   |   |
| <b>Defined values:</b>   | CELL<br>OTDOA<br>GPS<br>A-GPS<br>GNSS<br>A-GNSS<br>E-OTD<br>U-TDOA<br>AFLT<br>EFLT<br>E-CID<br>UNKNOWN<br>OTHER   | Cell coverage based positioning method<br>Observed Time Difference of Arrival (OTDOA) positioning method<br>Global Positioning System (GPS) based positioning method<br>Assisted GPS based positioning method<br>GNSS (GPS and GANSS) based positioning method<br>Assisted GNSS (GPS and GANSS) based positioning method<br>Enhanced Observed Time Difference (E-OTD) positioning method<br>Uplink Time Difference of Arrival (U-TDOA) positioning method<br>Advanced Forward Link Triangulation positioning method<br>Enhanced Forward Link Triangulation positioning method<br>Enhancement Cell ID positioning method<br>Unknown positioning method<br>Any other positioning method |
| <b>Default value:</b>  |   |   |
| <b>Example:</b>  | <eme_pos pos_method="A-GPS"> ... </eme_pos>   |   |
| <b>Note:</b>   | The list of current values reflects the status quo described in 3GPP TS 23.271, V6.7.0, sect. 4.3 (plus A-GPS) and TIA-801. New values may be added as soon as the need arises. |   |

### 5.3.29 esrd

|  |             |
|--|-------------|
| <b>Description:</b>  |             |
| This element specifies Emergency Services Routing Digits (ESRD). |             |
| <b>Type:</b>   | Element     |
| <b>Format:</b>   | Char string |
| <b>Defined values:</b>   |             |

|                       |                           |
|-----------------------|---------------------------|
| <b>Default value:</b> |                           |
| <b>Example:</b>       | <esrd>761287612582</esrd> |
| <b>Note:</b>          |                           |

### 5.3.29.1 type

|                                |   |   |
|--------------------------------|---|---|
| <b>Description:</b>            |   |   |
| Defines the origin of the ESRD |   |   |
| <b>Type:</b>                   | Attribute   |   |
| <b>Format:</b>                 | Char string   |   |
| <b>Defined values:</b>         | NA  | Indicates that the ERSR is defined as the North American ESRD (NA-ESRD). NA-ESRD is a telephone number in the North American Numbering Plan that can be used to identify a North American emergency services provider and its associated Location Services client.<br>The NA-ESRD also identifies the base station, cell site or sector from which a North American emergency call originates |
| <b>Default value:</b>          | NA  |   |
| <b>Example:</b>                | <esrd type="NA">12345678</ersd>   |   |
| <b>Note:</b>                   | Currently only NA is specified. It is expected that other origins will be specified in the future |   |

### 5.3.30 esrk

|   |                           |  |
|---|---------------------------|--|
| <b>Description:</b>                                     |                           |  |
| This element specifies the Services Routing Key (ESRK). |                           |  |
| <b>Type:</b>  | Element                   |  |
| <b>Format:</b>  | Char string               |  |
| <b>Defined values:</b>                                  | -                         |  |
| <b>Default value:</b>                                   | -                         |  |
| <b>Example:</b>   | <esrk>928273633343</esrk> |  |
| <b>Note:</b>  | -                         |  |

### 5.3.30.1 type

|                                |   |   |
|--------------------------------|---|---|
| <b>Description:</b>            |   |   |
| Defines the origin of the ESRK |   |   |
| <b>Type:</b>                   | Attribute   |   |
| <b>Format:</b>                 | Char string   |   |
| <b>Defined values:</b>         | NA  | Indicates that the ESRK is defined as the North American ESRK (NA-ESRK). NA-ESRK is a telephone number in the North American Numbering Plan that is assigned to an emergency services call for the duration of the call. The NA-ESRK is used to identify (e.g. route to) both the emergency services provider and the switch currently serving the emergency caller. During the lifetime of an emergency services call, the NA-ESRK also identifies the calling subscriber. |
| <b>Default value:</b>          | NA  |   |
| <b>Example:</b>                | <esrk type="NA">12345678</ersk>   |   |
| <b>Note:</b>                   | Currently only NA is specified. It is expected that other origins will be specified in the future |   |

### 5.3.31 equidistance\_event

|   |   |
|---|---|
| <b>Description:</b>   |   |
| Specifies an equidistance event in triggered location reporting service |   |
| <b>Type:</b>  | Element   |
| <b>Format:</b>  |   |
| <b>Defined values:</b>  |   |
| <b>Default value:</b>   |   |
| <b>Example:</b>   | <equidistance_event type="ENTERING_TARGET_EQUIDISTANCE"><br><target_equidistance>30000</target_equidistance><br></equidistance_event> |
| <b>Note:</b>  |   |

#### 5.3.31.1 loc\_estimates

See section 5.3.13.2.

### 5.3.32 Height

|  |   |
|--|---|
| <b>Description:</b>                                      |   |
| This element specifies the requested height of map image |   |
| <b>Type:</b>   | Element   |
| <b>Format:</b>   | Char String   |
| <b>Defined values:</b>                                   | [0-9]+  |
| <b>Default value:</b>                                    | 0   |
| <b>Example:</b>  | <Height>600</Height>                                |
| <b>Note:</b>   | The default type of map height is defined as pixel. |

### 5.3.33 Hemisphere

|  |  |
|--|--|
| <b>Description:</b>  |  |
| first and the mandatory component in the representation of a location in UTM coordinate system |  |
| <b>Type:</b>   | Element  |
| <b>Format:</b>   | Char string  |
| <b>Defined values:</b>   | NORTH        It specifies the zone in the north of the equator<br>SOUTH      It specified the zone in the south of the equator |
| <b>Default value:</b>  |  |
| <b>Example:</b>  | <Hemisphere>NORTH</Hemisphere>   |
| <b>Note:</b>   | Stands for Hemisphere of a position in UTM Coordinate System.  |

### 5.3.34 hor\_acc

|                               |  |
|-------------------------------|--|
| <b>Description:</b>           |  |
| Horizontal accuracy in meters |  |

|                        |                        |
|------------------------|------------------------|
| <b>Type:</b>           | Element                |
| <b>Format:</b>         | Char String            |
| <b>Defined values:</b> | [0-9]+                 |
| <b>Default value:</b>  |                        |
| <b>Example:</b>        | <hor_acc>200</hor_acc> |
| <b>Note:</b>           |                        |

### 5.3.34.1 qos\_class

See section 5.3.3.1

## 5.3.35 id

|  |  |
|--|--|
| <b>Description:</b>  |  |
| A string defining the name of a registered user performing a location request. In an answer the string represents the name of a location server. |  |
| <b>Type:</b>   | Element                                  |
| <b>Format:</b>   | Char string                              |
| <b>Defined values:</b>   |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>  | <id>TheTruckCompany</id>                 |
| <b>Note:</b>   | This element is implementation specific. |

## 5.3.36 imsi

|   |                              |
|---|------------------------------|
| <b>Description:</b>   |                              |
| The International Mobile Subscriber Identity number as specified in 3GPP TS 23.003 and ITU-T E212 Recommendation. |                              |
| <b>Type:</b>  | Element                      |
| <b>Format:</b>  | Char String                  |
| <b>Defined values:</b>  | -                            |
| <b>Default value:</b>   | -                            |
| <b>Example:</b>   | <imsi>123456789012345</imsi> |
| <b>Note:</b>  | -                            |

## 5.3.37 inRadius

|   |   |
|---|---|
| <b>Description:</b>   |   |
| The inner radius is the geodesic distance (in distannceUnit) between the center of the circle (that the arc is a part of) and the arc closest to the center |   |
| <b>Type:</b>  | Element   |
| <b>Format:</b>  | Char String   |
| <b>Defined values:</b>  | [0-9]+  |
| <b>Default value:</b>   |   |
| <b>Example:</b>   | <inRadius>100</inRadius>  |
| <b>Note:</b>  | If the inner radius is 0 (zero) the area described represents a sector of a circle. |

### 5.3.38 interval

| <b>Description:</b>  |  |        |             |    |                                  |    |                                   |    |                                     |    |                                     |
|--|--|--------|-------------|----|----------------------------------|----|-----------------------------------|----|-------------------------------------|----|-------------------------------------|
| Specifies the interval between two responses in case of a TLRR indicating timer controlled, periodic responses or minimum interval between reported positions in case of HLIR. |  |        |             |    |                                  |    |                                   |    |                                     |    |                                     |
| <b>Type:</b>   | Element  |        |             |    |                                  |    |                                   |    |                                     |    |                                     |
| <b>Format:</b>   | Char string<br>The interval is expressed as ddhhmmss where:  |        |             |    |                                  |    |                                   |    |                                     |    |                                     |
|  | <table border="1"> <thead> <tr> <th>String</th><th>Description</th></tr> </thead> <tbody> <tr> <td>dd</td><td>Number of days between responses</td></tr> <tr> <td>hh</td><td>Number of hours between responses</td></tr> <tr> <td>mm</td><td>Number of minutes between responses</td></tr> <tr> <td>ss</td><td>Number of seconds between responses</td></tr> </tbody> </table> | String | Description | dd | Number of days between responses | hh | Number of hours between responses | mm | Number of minutes between responses | ss | Number of seconds between responses |
| String   | Description  |        |             |    |                                  |    |                                   |    |                                     |    |                                     |
| dd   | Number of days between responses   |        |             |    |                                  |    |                                   |    |                                     |    |                                     |
| hh   | Number of hours between responses  |        |             |    |                                  |    |                                   |    |                                     |    |                                     |
| mm   | Number of minutes between responses  |        |             |    |                                  |    |                                   |    |                                     |    |                                     |
| ss   | Number of seconds between responses  |        |             |    |                                  |    |                                   |    |                                     |    |                                     |
| <b>Defined values:</b>   |  |        |             |    |                                  |    |                                   |    |                                     |    |                                     |
| <b>Default value:</b>  |  |        |             |    |                                  |    |                                   |    |                                     |    |                                     |
| <b>Example:</b>  | <interval>00010000</interval>  |        |             |    |                                  |    |                                   |    |                                     |    |                                     |
| <b>Note:</b>   |  |        |             |    |                                  |    |                                   |    |                                     |    |                                     |

### 5.3.39 ip\_address

|   |   |
|---|---|
| <b>Description:</b>   |   |
| This element represents an identifier of the IP address used by a terminal. |   |
| <b>Type:</b>  | Element                                 |
| <b>Format:</b>  | Char string                             |
| <b>Defined values:</b>  | As per [RFC796] IPV4 or [RFC3513] IPV6  |
| <b>Default value:</b>   |   |
| <b>Example:</b>   | <ip_address>147.211.234.10</ip_address> |
| <b>Note:</b>  |   |

### 5.3.40 lac

|                                   |   |
|-----------------------------------|---|
| <b>Description:</b>               |   |
| Identifies the Location Area Code |   |
| <b>Type:</b>                      | Element   |
| <b>Format:</b>                    | Char String   |
| <b>Defined values:</b>            | 1-65535   |
| <b>Default value:</b>             |   |
| <b>Example:</b>                   | <lac>234</lac>  |
| <b>Note:</b>                      | Location Area Code (LAC) is a fixed length code (of 2 octets) identifying a location area within a GSM PLMN. This part of the location area identification can be coded using a full hexadecimal representation, except for the following reserved hexadecimal values: 0000, and FFFE |

### 5.3.41 lcs\_ref

|  |  |
|--|--|
| <b>Description:</b>  |  |
| The LDR reference number received from Home Location Server. For more information see [23.271] |  |

|                        |  |
|------------------------|--|
| <b>Type:</b>           | Element  |
| <b>Format:</b>         | Char String  |
| <b>Defined values:</b> | Two decimal digits, 00-64  |
| <b>Default value:</b>  | -  |
| <b>Example:</b>        | <lcs_ref>50</lcs_ref>  |
| <b>Note:</b>           | Lcs_ref SHALL be sent in the triggered location reporting request with change of area event or MS_AVAIL event and combined triggered location reporting request with periodic event / MS_AVAIL event request case. The LDR reference number is received as one octet and shall be encoded to the decimal numbers 00 to 64. |

### 5.3.42 lev\_conf

|                        |   |
|------------------------|---|
| <b>Description:</b>    |   |
|                        | This parameter indicates the probability in percent that the MS is located in the position area that is returned. |
| <b>Type:</b>           | Element   |
| <b>Format:</b>         | Char String   |
| <b>Defined values:</b> | 0-100   |
| <b>Default value:</b>  |   |
| <b>Example:</b>        | <lev_conf>80</lev_conf>   |
| <b>Note:</b>           |   |

### 5.3.43 LinearRing

|                        |  |
|------------------------|--|
| <b>Description:</b>    |  |
|                        | A linear ring is a closed, simple piece-wise linear path which is defined by a list of coordinates that are assumed to be connected by straight-line segments. If the element is used in the construction of a Polygon the last coordinate MAY be different to the first coordinate, otherwise the last coordinate must be coincident with the first coordinate.   |
| <b>Type:</b>           | Element  |
| <b>Format:</b>         |  |
| <b>Defined values:</b> |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>        | <pre>&lt;LinearRing srsName="www.epsg.org#4326" gid="some_thing"&gt;   &lt;coord&gt;     &lt;X&gt;30 27 45.3N&lt;/X&gt;     &lt;Y&gt;45 25 52.9E&lt;/Y&gt;   &lt;/coord&gt;   &lt;coord&gt;     &lt;X&gt;40 27 45.3N&lt;/X&gt;     &lt;Y&gt;48 25 52.9E&lt;/Y&gt;   &lt;/coord&gt;   &lt;coord&gt;     &lt;X&gt;33 27 45.3N&lt;/X&gt;     &lt;Y&gt;46 25 52.9E&lt;/Y&gt;   &lt;/coord&gt;   &lt;coord&gt;     &lt;X&gt;30 27 45.3N&lt;/X&gt;     &lt;Y&gt;45 25 52.9E&lt;/Y&gt;   &lt;/coord&gt; &lt;/LinearRing&gt;</pre> |
| <b>Note:</b>           |  |

### 5.3.43.1 gid

See section 5.3.10.1.

### 5.3.43.2 srsName

See section 5.3.10.2.

## 5.3.44 LineString

| <b>Description:</b>   |   |
|---|---|
| A line string is a piece-wise linear path which is defined by a list of coordinates that are assumed to be connected by straight-line segments. |   |
| <b>Type:</b>  | Element   |
| <b>Format:</b>  |   |
| <b>Defined values:</b>  |   |
| <b>Default value:</b>   |   |
| <b>Example:</b>   | <pre>&lt;LineString srsName="www.epsg.org#4326" gid="some_thing"&gt;   &lt;coord&gt;     &lt;X&gt;30 27 45.3N&lt;/X&gt;     &lt;Y&gt;48 25 52.9E&lt;/Y&gt;   &lt;/coord&gt;   &lt;coord&gt;     &lt;X&gt;40 27 45.3N&lt;/X&gt;     &lt;Y&gt;48 25 52.9E&lt;/Y&gt;   &lt;/coord&gt;   &lt;coord&gt;     &lt;X&gt;33 27 45.3N&lt;/X&gt;     &lt;Y&gt;48 25 52.9E&lt;/Y&gt;   &lt;/coord&gt; &lt;/LineString&gt;</pre> |
| <b>Note:</b>  |   |

### 5.3.44.1 gid

See section 5.3.10.1.

### 5.3.44.2 srsName

See section 5.3.10.2.

## 5.3.45 ll\_acc

| <b>Description:</b>                         |                      |
|---|----------------------|
| Longitude and latitude accuracy in seconds. |                      |
| <b>Type:</b>                                | Element              |
| <b>Format:</b>                              | Char String          |
| <b>Defined values:</b>                      |                      |
| <b>Default value:</b>                       |                      |
| <b>Example:</b>                             | <ll_acc>7.5</ll_acc> |
| <b>Note:</b>                                |                      |

### 5.3.45.1 qos\_class

see section 5.3.3.1

## 5.3.46 lmsi

|   |                               |
|---|-------------------------------|
| <b>Description:</b>   |                               |
| A local identity allocated by the VLR to a given subscriber for internal management of data in the VLR as defined in [29.002] |                               |
| <b>Type:</b>  | Element                       |
| <b>Format:</b>  | Char String                   |
| <b>Defined values:</b>  |                               |
| <b>Default value:</b>   |                               |
| <b>Example:</b>   | <lmsi>234</lmsi>              |
| <b>Note:</b>  | The LMSI consists of 4 octets |

### 5.3.47 loc\_type

|   |                             |
|---|-----------------------------|
| <b>Description:</b>                     |                             |
| Defines the type of location requested. |                             |
| <b>Type:</b>                            | Element                     |
| <b>Format:</b>                          | Void                        |
| <b>Defined values:</b>                  |                             |
| <b>Default value:</b>                   |                             |
| <b>Example:</b>                         | <loc_type type="INITIAL" /> |
| <b>Note:</b>                            |                             |

### 5.3.47.1 type

|  |  |         |   |      |  |                 |  |                 |   |
|--|--|---------|---|------|--|-----------------|--|-----------------|---|
| <b>Description:</b>                    |  |         |   |      |  |                 |  |                 |   |
| Defines the type of location requested |  |         |   |      |  |                 |  |                 |   |
| <b>Type:</b>                           | Attribute  |         |   |      |  |                 |  |                 |   |
| <b>Format:</b>                         | Char string  |         |   |      |  |                 |  |                 |   |
| <b>Defined values:</b>                 | <table border="1"> <tr> <td>CURRENT</td> <td>After a location attempt has successfully delivered a location estimate and its associated time stamp, the location estimate and time stamp is known as the current location at that point in time.</td> </tr> <tr> <td>LAST</td> <td>The current location estimate and its associated time stamp is generally stored in the network and is known as the last known location until replaced by a later location estimate and a new time stamp. The last known location may be distinct from the initial location, i.e., more recent.</td> </tr> <tr> <td>LAST_OR_CURRENT</td> <td>If the last known location is stored in the network and if this location satisfies the Quality of Service requested by the location-based application the last known location is returned, otherwise the current location is returned.</td> </tr> <tr> <td>CURRENT_OR_LAST</td> <td>If a location attempt has successfully delivered a current location, it is returned. Otherwise if the last known location stored in the network satisfies the requested Quality of service the last known location is returned.</td> </tr> </table> | CURRENT | After a location attempt has successfully delivered a location estimate and its associated time stamp, the location estimate and time stamp is known as the current location at that point in time. | LAST | The current location estimate and its associated time stamp is generally stored in the network and is known as the last known location until replaced by a later location estimate and a new time stamp. The last known location may be distinct from the initial location, i.e., more recent. | LAST_OR_CURRENT | If the last known location is stored in the network and if this location satisfies the Quality of Service requested by the location-based application the last known location is returned, otherwise the current location is returned. | CURRENT_OR_LAST | If a location attempt has successfully delivered a current location, it is returned. Otherwise if the last known location stored in the network satisfies the requested Quality of service the last known location is returned. |
| CURRENT                                | After a location attempt has successfully delivered a location estimate and its associated time stamp, the location estimate and time stamp is known as the current location at that point in time.  |         |   |      |  |                 |  |                 |   |
| LAST                                   | The current location estimate and its associated time stamp is generally stored in the network and is known as the last known location until replaced by a later location estimate and a new time stamp. The last known location may be distinct from the initial location, i.e., more recent.   |         |   |      |  |                 |  |                 |   |
| LAST_OR_CURRENT                        | If the last known location is stored in the network and if this location satisfies the Quality of Service requested by the location-based application the last known location is returned, otherwise the current location is returned.   |         |   |      |  |                 |  |                 |   |
| CURRENT_OR_LAST                        | If a location attempt has successfully delivered a current location, it is returned. Otherwise if the last known location stored in the network satisfies the requested Quality of service the last known location is returned.  |         |   |      |  |                 |  |                 |   |

|                       |                                 |  |
|-----------------------|---------------------------------|--|
|                       | <b>INITIAL</b>                  | In an originating emergency call, the location estimate and the associated time stamp at the commencement of the call set-up is known as the initial location.   |
|                       | <b>CURRENT_AND_INTERMEDIATE</b> | In addition to delivery of a final current location estimate (or error indication) the location server shall, if applicable, deliver one or more intermediate location estimates not fulfilling the QoP. |
| <b>Default value:</b> | CURRENT                         |  |
| <b>Example:</b>       | <loc_type type="INITIAL" />     |  |
| <b>Note:</b>          |                                 |  |

### 5.3.47.2 per\_type

|   |  |                 |  |                      |   |              |   |
|---|--|-----------------|--|----------------------|---|--------------|---|
| <b>Description:</b>                             |  |                 |  |                      |   |              |   |
| Defines the type of periodic location requested |  |                 |  |                      |   |              |   |
| <b>Type:</b>                                    | Attribute  |                 |  |                      |   |              |   |
| <b>Format:</b>                                  | Char string  |                 |  |                      |   |              |   |
| <b>Defined values:</b>                          | <table> <tr> <td><b>REALTIME</b></td> <td>Location Reports shall be sent to MLS Client at the requested interval independent if current position estimate is available or not.</td> </tr> <tr> <td><b>QUASIREALTIME</b></td> <td>Location Reports shall be sent to MLS Client at the requested interval if current position estimates are available. If current position estimate is unavailable due to lack of communication with the target, no report shall be sent. If position estimates later becomes available they shall immediately be sent to MLS Client</td> </tr> <tr> <td><b>BATCH</b></td> <td>Location Reports shall be sent to MLS Client when batch condition is fulfilled or when service is terminated.</td> </tr> </table> | <b>REALTIME</b> | Location Reports shall be sent to MLS Client at the requested interval independent if current position estimate is available or not. | <b>QUASIREALTIME</b> | Location Reports shall be sent to MLS Client at the requested interval if current position estimates are available. If current position estimate is unavailable due to lack of communication with the target, no report shall be sent. If position estimates later becomes available they shall immediately be sent to MLS Client | <b>BATCH</b> | Location Reports shall be sent to MLS Client when batch condition is fulfilled or when service is terminated. |
| <b>REALTIME</b>                                 | Location Reports shall be sent to MLS Client at the requested interval independent if current position estimate is available or not.   |                 |  |                      |   |              |   |
| <b>QUASIREALTIME</b>                            | Location Reports shall be sent to MLS Client at the requested interval if current position estimates are available. If current position estimate is unavailable due to lack of communication with the target, no report shall be sent. If position estimates later becomes available they shall immediately be sent to MLS Client  |                 |  |                      |   |              |   |
| <b>BATCH</b>                                    | Location Reports shall be sent to MLS Client when batch condition is fulfilled or when service is terminated.  |                 |  |                      |   |              |   |
| <b>Default value:</b>                           | REALTIME   |                 |  |                      |   |              |   |
| <b>Example:</b>                                 | <loc_type per_type="BATCH" />  |                 |  |                      |   |              |   |
| <b>Note:</b>                                    |  |                 |  |                      |   |              |   |

### 5.3.48 MapRequest

|  |  |
|--|--|
| <b>Description:</b> Specifies the format of requested map information. |  |
| <b>The Map Request</b>   |  |
| <b>Type:</b>   | Element  |
| <b>Format:</b>   | Char String  |
| <b>Defined values:</b>   |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>  | <pre>&lt;MapRequest MapdataType="MAP" MimeType="PNG"&gt; &lt;Width&gt;800&lt;/Width&gt; &lt;Height&gt;600&lt;/Height&gt; &lt;Zoom ZoomType="KILOMETER"&gt;1&lt;/Zoom&gt; &lt;/MapRequest&gt;</pre> |
| <b>Note:</b>   | The map image is rendered by location server based on the MapRequest settings.   |

### 5.3.48.1 MapdataType

|   |
|---|
| <b>Description:</b>   |
| This element specifies The the content type of Map data Request |

|                        |  |
|------------------------|--|
| <b>Type:</b>           | Attribute  |
| <b>Format:</b>         | Char String  |
| <b>Defined values:</b> |  |
| <b>Default value:</b>  | MAP specifies the map image request.                         |
|                        | URL specifies the request for the url address of map image . |
| <b>Example:</b>        | <MapRequest MapdataType="MAP" >                              |

### 5.3.48.2MimeType

|   |                              |   |
|---|------------------------------|---|
| <b>Description:</b>                               |                              |   |
| This element specifies the mime type of map image |                              |   |
| <b>Type:</b>                                      | Element                      |   |
| <b>Format:</b>                                    | Char String                  |   |
| <b>Defined values:</b>                            | GIF<br>JPEG<br>PNG<br>TIFF   | it specifies the image format designed by Generation IV International Forum<br>it specifies the image format designed by Joint Photographic Experts Group<br>it specifies the image format designed by Portable Network Graphics<br>it specifies Tagged Image File Format |
| <b>Default value:</b>                             | PNG                          |   |
| <b>Example:</b>                                   | <MapRequest MimeType="PNG" > |   |
| <b>Note:</b>                                      |                              |   |

### 5.3.49 minimumIntervalTime

|   |  |
|---|--|
| <b>Description:</b>   |  |
| The minimum interval in seconds between reporting position for an Change of Area event. |  |
| <b>Type:</b>  | Element  |
| <b>Format:</b>  | Char string  |
| <b>Defined values:</b>  | Maximum number of seconds (must be $\geq 0$ )                        |
| <b>Default value:</b>   | Implementation specific.   |
| <b>Example:</b>   | <minimumIntervalTime>30</minimumIntervalTime>                        |
| <b>Note:</b>  | This element prevents flooding the LCS client with too many reports. |

### 5.3.50 max\_loc\_age

|  |   |
|--|---|
| <b>Description:</b>  |   |
| This states the maximum allowable age in seconds of a location sent as a response to a location request. This location information may have been cached somewhere in the system from a previous location update. |   |
| <b>Type:</b>   | Element                                       |
| <b>Format:</b>   | Char string                                   |
| <b>Defined values:</b>   | Maximum number of seconds (must be $\geq 0$ ) |

|                       |                                 |
|-----------------------|---------------------------------|
| <b>Default value:</b> | Implementation specific.        |
| <b>Example:</b>       | <max_loc_age>3600</max_loc_age> |
| <b>Note:</b>          |                                 |

### 5.3.51 mcc

|  |                               |
|--|-------------------------------|
| <b>Description:</b>                      |                               |
| Specifies the mobile country code (MCC). |                               |
| <b>Type:</b>                             | Element                       |
| <b>Format:</b>                           | Char String                   |
| <b>Defined values:</b>                   | 3 digits, e.g. 234 for the UK |
| <b>Default value:</b>                    |                               |
| <b>Example:</b>                          | <mcc>234</mcc>                |
| <b>Note:</b>                             |                               |

### 5.3.52 mnc

|                                    |                                   |
|------------------------------------|-----------------------------------|
| <b>Description:</b>                |                                   |
| Specifies the mobile network code. |                                   |
| <b>Type:</b>                       | Element                           |
| <b>Format:</b>                     | Char string                       |
| <b>Defined values:</b>             | 2 - 3 digits e.g. 15 for Vodafone |
| <b>Default value:</b>              |                                   |
| <b>Example:</b>                    | <mnc>215</mnc>                    |
| <b>Note:</b>                       |                                   |

### 5.3.53 MotionState

|   |   |
|---|---|
| <b>Description:</b>   |   |
| This element represents a motionstate of the target. The values are defined in LPPe [LPPe]. |   |
| <b>Type:</b>  | Element                                 |
| <b>Format:</b>  | Char string                             |
| <b>Defined values:</b>  |   |
| <b>Default value:</b>   |   |
| <b>Example:</b>   | <MotionState> pedestrian </MotionState> |
| <b>Note:</b>  |   |

### 5.3.54 MotionStateRequest

|   |         |
|---|---------|
| <b>Description:</b>                                   |         |
| Indication that motionstate information is requested. |         |
| <b>Type:</b>  | Element |
| <b>Format:</b>  | Void    |
| <b>Defined values:</b>                                |         |
| <b>Default value:</b>                                 |         |

|                 |  |
|-----------------|--|
| <b>Example:</b> |  |
| <b>Note:</b>    |  |

### 5.3.55 ms\_action

|   |                               |
|---|-------------------------------|
| <b>Description:</b>   |                               |
| Specifies the trigger that initiated the positioning of the MS. |                               |
| <b>Type:</b>  | Element                       |
| <b>Format:</b>  | Void                          |
| <b>Defined values:</b>  |                               |
| <b>Default value:</b>   |                               |
| <b>Example:</b>   | <ms_action type="MS_AVAIL" /> |
| <b>Note:</b>  |                               |

#### 5.3.55.1 type

|   |   |
|---|---|
| <b>Description:</b>   |   |
| Specifies the trigger that initiated the positioning of the MS. |   |
| <b>Type:</b>  | Attribute   |
| <b>Format:</b>  | Char string   |
| <b>Defined values:</b>  | MS_AVAIL      The positioning is triggered by the MS available notification when the MS regains radio connection with the network if the connection was previously lost. For more information refer to 3GPP [23.271]. |
| <b>Default value:</b>   |   |
| <b>Example:</b>   | <ms_action type="MS_AVAIL" />   |
| <b>Note:</b>  |   |

### 5.3.56 msid

|  |  |
|--|--|
| <b>Description:</b>  |  |
| This element represents an identifier of a mobile subscriber |  |
| <b>Type:</b>   | Element  |
| <b>Format:</b>   | Char string  |
| <b>Defined values:</b>                                       |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>  | <msid>460703057640</msid>  |
| <b>Note:</b>   | When appropriate the MSID type format SHOULD conform to the full standardised international representation of the MSID type, without any additional unspecified characters or spaces. As an example the GSM/3GPP identifiers SHOULD conform to 3GPP [23.003] |

#### 5.3.56.1 type

|  |             |
|--|-------------|
| <b>Description:</b>                          |             |
| Type of identifier for the mobile subscriber |             |
| <b>Type:</b>                                 | Attribute   |
| <b>Format:</b>                               | Char string |

|                        |                    |  |
|------------------------|--------------------|--|
| <b>Defined values:</b> | MSISDN             | Mobile Station International ISDN Number [23.003]  |
|                        | IMSI               | International Mobile Subscriber Identity [23.003], [J-STD-036]   |
|                        | IMEI               | International Mobile station Equipment Identity [23.003]   |
|                        | MIN                | Mobile Identification Number [IS-41D]  |
|                        | MDN                | Mobile Directory Number [IS-41D]   |
|                        | EME_MSID           | Emergency MSID   |
|                        | ASID               | Anonymous Subscriber Identity  |
|                        | IPV4               | Mobile station IP address (Version 4) [RFC796]   |
|                        | OPE_ID             | Operator specific Identity   |
|                        | IPV6               | Mobile station IP address (Version 6) [RFC3513]  |
|                        | SESSID             | Session identifier relating to the user, which MAY be anonymous  |
|                        | SIP_URI            | IMS Public User Identity ( <b>Session Initiation Protocol Uniform Resource Identifier</b> ) [RFC 3261] |
|                        | TEL_URL            | Telephone Uniform Resource Locator [RFC 2806]  |
|                        | NAI                | Network Access Identifier [RFC 4282]   |
|                        | URI                | Uniform Resource Identifier [RFC 3986]   |
| <b>Default value:</b>  | MSISDN             |  |
| <b>Example:</b>        | <msid type="IMSI"> |  |
| <b>Note:</b>           |                    |  |

### 5.3.56.2 enc

|                        |   |   |
|------------------------|---|---|
| <b>Description:</b>    | Type of encoding of MSID identifier for the mobile subscriber |   |
| <b>Type:</b>           | Attribute   |   |
| <b>Format:</b>         | Char string   |   |
| <b>Defined values:</b> | ASC   | Normal textual format   |
|                        | CRP   | Encrypted format: Can be used to protect target privacy by only proving the LCS client with an Encrypted MSID |
| <b>Default value:</b>  | ASC   |   |
| <b>Example:</b>        | <msid type="IMSI" enc="ASC">                                  |   |
| <b>Note:</b>           |   |   |

### 5.3.57 msid\_group

|                        |   |  |
|------------------------|---|--|
| <b>Description:</b>    | This element represents an identifier of a group of mobile subscribers. |  |
| <b>Type:</b>           | Element   |  |
| <b>Format:</b>         | Char string   |  |
| <b>Defined values:</b> |   |  |
| <b>Default value:</b>  |   |  |
| <b>Example:</b>        | <msid_group>ALL</msid_group>  |  |
| <b>Note:</b>           |   |  |

## 5.3.58 MultiLineString

|                        |   |
|------------------------|---|
| <b>Description:</b>    | A collection of line strings.   |
| <b>Type:</b>           | Element   |
| <b>Format:</b>         |   |
| <b>Defined values:</b> |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>        | <pre>&lt;MultiLineString srsName="www.epsg.org#4326" gid="some_thing"&gt;   &lt;LineString&gt;     ...   &lt;/LineString&gt; &lt;/MultiLineString&gt;</pre> |
| <b>Note:</b>           |   |

### 5.3.58.1 gid

See section 5.3.10.1.

### 5.3.58.2 srsName

see section 5.3.10.2.

## 5.3.59 MultiPoint

|                        |   |
|------------------------|---|
| <b>Description:</b>    | A collection of points.   |
| <b>Type:</b>           | Element   |
| <b>Format:</b>         |   |
| <b>Defined values:</b> |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>        | <pre>&lt;MultiPoint srsName="www.epsg.org#4326" gid="some_thing"&gt;   &lt;Point&gt;     ...   &lt;/Point&gt; &lt;/MultiPoint&gt;</pre> |
| <b>Note:</b>           |   |

### 5.3.59.1 gid

See section 5.3.10.1.

### 5.3.59.2 srsName

See section 5.3.10.2.

## 5.3.60 MultiPolygon

|                     |
|---------------------|
| <b>Description:</b> |
|---------------------|

|                           |  |
|---------------------------|--|
| A collection of polygons. |  |
| <b>Type:</b>              | Element  |
| <b>Format:</b>            |  |
| <b>Defined values:</b>    | -  |
| <b>Default value:</b>     | -  |
| <b>Example:</b>           | <MultiPolygon srsName="www.epsg.org#4326" gid="some_thing"><br><Polygon><br>...<br></Polygon><br></MultiPolygon> |
| <b>Note:</b>              |  |

### 5.3.60.1 gid

See section 5.3.10.1.

### 5.3.60.2 srsName

See section 5.3.10.2.

## 5.3.61 name\_area

|   |                              |
|---|------------------------------|
| <b>Description:</b>   |                              |
| Specify the geopolitical name of area in change_area event. |                              |
| <b>Type:</b>  | Element                      |
| <b>Format:</b>  | Char string                  |
| <b>Defined values:</b>                                      |                              |
| <b>Default value:</b>                                       |                              |
| <b>Example:</b>   | <name_area>Seoul</name_area> |
| <b>Note:</b>  |                              |

## 5.3.62 ndc

|  |   |
|--|---|
| <b>Description:</b>                      |   |
| Specifies the national destination code. |   |
| <b>Type:</b>                             | Element   |
| <b>Format:</b>                           | Char string   |
| <b>Defined values:</b>                   | Variable length depending upon the requirements of the destination country. |
| <b>Default value:</b>                    |   |
| <b>Example:</b>                          | <ndc>215</ndc>  |
| <b>Note:</b>                             |   |

## 5.3.63 nmr

|  |  |
|--|--|
| <b>Description:</b>                                    |  |
| Network specific measurement result for the target MS. |  |

|                        |  |
|------------------------|--|
| <b>Type:</b>           | Element  |
| <b>Format:</b>         | Char string  |
| <b>Defined values:</b> | For examples see relevant standards documents.   |
| <b>Default value:</b>  |  |
| <b>Example:</b>        |  |
| <b>Note:</b>           | Measurement Results are encoded as 34 hexadecimal characters representing, 17 binary octets, in accordance with the Measurement Result information element described in [04.18]. |

### 5.3.64 no\_of\_reports

|   |                                  |
|---|----------------------------------|
| <b>Description:</b>   |                                  |
| Specify the maximum number of reports for a TLRR or HLIR request. |                                  |
| <b>Type:</b>  | Element                          |
| <b>Format:</b>  | Char String                      |
| <b>Defined values:</b>  | [1-9]+                           |
| <b>Default value:</b>   | 1                                |
| <b>Example:</b>   | <no_of_reports>5</no_of_reports> |
| <b>Note:</b>  |                                  |

### 5.3.65 outRadius

|   |                            |
|---|----------------------------|
| <b>Description:</b>   |                            |
| The radius of a circle furthest away from the position in a CircularArcArea. The value is in the distanceUnit |                            |
| <b>Type:</b>  | Element                    |
| <b>Format:</b>  | Char String                |
| <b>Defined values:</b>  | [0-9]+                     |
| <b>Default value:</b>   |                            |
| <b>Example:</b>   | <outRadius>120</outRadius> |
| <b>Note:</b>  |                            |

### 5.3.66 plmn

|   |   |
|---|---|
| <b>Description:</b>   |   |
| A unique identity of Public Land Mobile Network as defined in [23.003]. |   |
| <b>Type:</b>  | Element   |
| <b>Format:</b>  | Char String   |
| <b>Defined values:</b>  |   |
| <b>Default value:</b>   |   |
| <b>Example:</b>   | <pre>&lt;plmn&gt;   &lt;mcc&gt;234&lt;/mcc&gt;   &lt;mnc&gt;215&lt;/mnc&gt; &lt;/plmn&gt;</pre> |
| <b>Note:</b>  |   |

### 5.3.67 Point

|                     |
|---------------------|
| <b>Description:</b> |
|---------------------|

|                         |   |
|-------------------------|---|
| A geographic coordinate |   |
| Type:                   | Element   |
| Format:                 |   |
| Defined values:         |   |
| Default value:          |   |
| Example:                | <pre>&lt;Point srsName="www.epsg.org#4326" gid="some_thing"&gt;   &lt;coord&gt;     &lt;X&gt;30 27 45.3N&lt;/X&gt;     &lt;Y&gt;45 25 52.9E&lt;/Y&gt;   &lt;/coord&gt; &lt;/Point&gt;</pre> |
| Note:                   |   |

### 5.3.67.1 gid

See section 5.3.10.1.

### 5.3.67.2 srsName

See section 5.3.10.2.

## 5.3.68 Polygon

|  |  |
|--|--|
| <b>Description:</b>  |  |
| A connected surface. Any pair of points in the polygon can be connected to one another by a path. The boundary of the Polygon is a set of LinearRings. We distinguish the outer (exterior) boundary and the inner (interior) boundaries; the LinearRings of the interior boundary cannot cross one another and cannot be contained within one another. |  |
| Type:  | Element  |
| Format:  |  |
| Defined values:  |  |
| Default value:   |  |
| Example:   | <pre>&lt;Polygon srsName="www.epsg.org#4326" gid="some_thing"&gt;   &lt;outerBoundaryIs&gt;     ...   &lt;/outerBoundaryIs &gt; &lt;/Polygon&gt;</pre> |
| Note:  |  |

### 5.3.68.1 gid

See section 5.3.10.1.

### 5.3.68.2 srsName

See section 5.3.10.2.

## 5.3.69 pos

|   |         |
|---|---------|
| <b>Description:</b>   |         |
| Specifies the position of the MS in an immediate location service response. |         |
| Type:   | Element |
| Format:   |         |

|                        |   |
|------------------------|---|
| <b>Defined values:</b> |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>        | <pre>&lt;pos&gt;   &lt;msid&gt;4711&lt;/msid&gt;   &lt;poserr&gt;     &lt;result resid="1"&gt;SYSTEM FAILURE&lt;/result&gt;     &lt;time utc_off="0200"&gt;20040617143232&lt;/time&gt;   &lt;/poserr&gt; &lt;/pos&gt;</pre> |
| <b>Note:</b>           |   |

### 5.3.69.1 pos\_method

See section 5.3.28.1

### 5.3.69.2 result\_type

|  |   |
|--|---|
| <b>Description:</b>                          |   |
| Defines the type of location_result reported |   |
| <b>Type:</b>                                 | Attribute   |
| <b>Format:</b>                               | Char string   |
| <b>Defined values:</b>                       | INTERMEDIATE      The location estimate in the pos element is not deemed to fulfil the QoP and will be followed by a final location estimate.<br>FINAL                The pos element contains the final location estimate or poserror. |
| <b>Default value:</b>                        | FINAL   |
| <b>Example:</b>                              | <result_type="INTERMEDIATE" />  |
| <b>Note:</b>                                 |   |

## 5.3.70 prio

|  |          |
|--|----------|
| <b>Description:</b>                        |          |
| Defines the priority of a location request |          |
| <b>Type:</b>                               | Element  |
| <b>Format:</b>                             | Void     |
| <b>Defined values:</b>                     |          |
| <b>Default value:</b>                      |          |
| <b>Example:</b>                            | <prio /> |
| <b>Note:</b>                               |          |

### 5.3.70.1 type

|  |  |
|--|--|
| <b>Description:</b>                        |  |
| Defines the priority of a location request |  |
| <b>Type:</b>                               | Attribute  |
| <b>Format:</b>                             | Char string  |
| <b>Defined values:</b>                     | NORMAL      The request is handled with normal priority<br>HIGH          The request is handled with high priority |
| <b>Default value:</b>                      | NORMAL   |
| <b>Example:</b>                            | <prio type="HIGH" />   |

|       |  |
|-------|--|
| Note: |  |
|-------|--|

### 5.3.71 pwd

|  |                    |
|--|--------------------|
| <b>Description:</b>  |                    |
| The password for the registered user performing a location request. In this answer the string represents the password for a location server. |                    |
| <b>Type:</b>   | Element            |
| <b>Format:</b>   | Char string        |
| <b>Defined values:</b>   |                    |
| <b>Default value:</b>  |                    |
| <b>Example:</b>  | <pwd>the5pwd</pwd> |
| <b>Note:</b>   |                    |

### 5.3.72 qos\_not\_met

|   |  |
|---|--|
| <b>Description:</b>                                       |  |
| Indication that the requested QoS was not met, if needed. |  |
| <b>Type:</b>  | Element  |
| <b>Format:</b>  | Void   |
| <b>Defined values:</b>                                    |  |
| <b>Default value:</b>                                     |  |
| <b>Example:</b>   |  |
| <b>Note:</b>  | Only applicable if the request was for best effort class, i.e. a location estimate is returned (rather than an error) although the requested QoS requirement could not be fulfilled. |

### 5.3.73 query\_id

|   |                            |
|---|----------------------------|
| <b>Description:</b>   |                            |
| Unique identification of a triggered location reporting query request |                            |
| <b>Type:</b>  | Element                    |
| <b>Format:</b>  | Char string                |
| <b>Defined values:</b>  |                            |
| <b>Default value:</b>   |                            |
| <b>Example:</b>   | <req_id>435.23.01</req_id> |
| <b>Note:</b>  |                            |

### 5.3.74 radius

|  |             |
|--|-------------|
| <b>Description:</b>  |             |
| The uncertainty radius is the radius (in distanceUnit) of the uncertainty; this is the geodesic distance between the arc and the position point. |             |
| <b>Type:</b>   | Element     |
| <b>Format:</b>   | Char String |
| <b>Defined values:</b>   | [0-9]+      |
| <b>Default value:</b>  |             |

|                 |                      |
|-----------------|----------------------|
| <b>Example:</b> | <radius>850</radius> |
| <b>Note:</b>    |                      |

### 5.3.75 reference\_object

|                        |  |
|------------------------|--|
| <b>Description:</b>    |  |
|                        | Specifies the reference object in distance_event event.  |
| <b>Type:</b>           | Element  |
| <b>Format:</b>         | Void   |
| <b>Defined values:</b> |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>        | <pre>&lt;reference_object&gt;   &lt;msid&gt;461011678298&lt;/msid&gt; &lt;/ reference_object&gt;</pre> |
| <b>Note:</b>           |  |

#### 5.3.75.1 msid

See section 5.3.56.

### 5.3.76 req\_id

|                        |                                    |
|------------------------|------------------------------------|
| <b>Description:</b>    |                                    |
|                        | Unique identification of a request |
| <b>Type:</b>           | Element                            |
| <b>Format:</b>         | Char string                        |
| <b>Defined values:</b> |                                    |
| <b>Default value:</b>  |                                    |
| <b>Example:</b>        | <req_id>435.23.01</req_id>         |
| <b>Note:</b>           |                                    |

### 5.3.77 requested\_positiondata

|                        |   |   |
|------------------------|---|---|
| <b>Description:</b>    |   |   |
|                        | Defines the types of location info that is requested in location responses. |   |
| <b>Type:</b>           | Attribute   |   |
| <b>Format:</b>         | Char string   |   |
| <b>Defined values:</b> | SHAPE   | The returned positiondata should include a shape element                |
|                        | CIVICLOC  | The returned positiondata should include a civicloc element             |
|                        | SHAPE_AND_CIVICLOC  | The returned positiondata should include a shape and a civicloc element |
| <b>Default value:</b>  | SHAPE   |   |
| <b>Example:</b>        | <geoinfo shape_requested="SHAPE"></geoinfo>                                 |   |
| <b>Note:</b>           |   |   |

### 5.3.78 requestmode

|                        |   |
|------------------------|---|
| <b>Description:</b>    | Defines the type of the service that has been requested by the ASP.   |
| <b>Type:</b>           | Element   |
| <b>Format:</b>         | Void  |
| <b>Defined values:</b> |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>        | <requestmode type="ACTIVE" />   |
| <b>Note:</b>           | If the request mode is ‘ACTIVE’, the session element is included in msids of location request. The session element can be used as a credential by the Location Server or underlying network to verify that the request is actually ‘ACTIVE’. One example of this can be that the network verifies the number the target has dialed that is presented by the MLS Client in the session element. The session element is either the number called by the UE for a call related location request or the APN on which the UE established the session for a session related location request according to [23.271]. The LCS Client determines whether the LCS service request is call/session related or not. |

### 5.3.79 requestor

|                        |  |
|------------------------|--|
| <b>Description:</b>    | This element describes the originating entity which has requested the location of the target MS from the MLS client. |
| <b>Type:</b>           | Element  |
| <b>Format:</b>         | Compound   |
| <b>Defined values:</b> |  |
| <b>Default value:</b>  | n/a  |
| <b>Example:</b>        | <requestor><br><id>08154711</id><br></requestor>   |
| <b>Note:</b>           |  |

#### 5.3.79.1 type

|                        |   |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
|------------------------|---|------|--------------|--------|--------|------|------|--------|----------------|-----|-----|--------|---------|-----|---|-----|-----|------|------|-------|---|
| <b>Description:</b>    | This attribute represents the type of the requestor identifier  |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
| <b>Type:</b>           | Attribute   |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
| <b>Format:</b>         | Char String   |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
| <b>Defined values:</b> | <table> <tr> <td>NAME</td><td>Logical name</td></tr> <tr> <td>MSISDN</td><td>MSISDN</td></tr> <tr> <td>IMSI</td><td>IMSI</td></tr> <tr> <td>E-MAIL</td><td>E-mail address</td></tr> <tr> <td>URL</td><td>URL</td></tr> <tr> <td>SIPURL</td><td>SIP URL</td></tr> <tr> <td>IMS</td><td>IP multimedia subsystem public identity</td></tr> <tr> <td>MDN</td><td>MDN</td></tr> <tr> <td>ASID</td><td>ASID</td></tr> <tr> <td>ASPID</td><td>Logical name of an Application Service Provider that is associated with the Client or Subclient .</td></tr> </table> | NAME | Logical name | MSISDN | MSISDN | IMSI | IMSI | E-MAIL | E-mail address | URL | URL | SIPURL | SIP URL | IMS | IP multimedia subsystem public identity | MDN | MDN | ASID | ASID | ASPID | Logical name of an Application Service Provider that is associated with the Client or Subclient . |
| NAME                   | Logical name  |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
| MSISDN                 | MSISDN  |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
| IMSI                   | IMSI  |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
| E-MAIL                 | E-mail address  |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
| URL                    | URL   |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
| SIPURL                 | SIP URL   |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
| IMS                    | IP multimedia subsystem public identity   |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
| MDN                    | MDN   |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
| ASID                   | ASID  |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |
| ASPID                  | Logical name of an Application Service Provider that is associated with the Client or Subclient .   |      |              |        |        |      |      |        |                |     |     |        |         |     |   |     |     |      |      |       |   |

|                       |  |
|-----------------------|--|
| <b>Default value:</b> | MSISDN   |
| <b>Example:</b>       | <requestor type="SIPURL"><br><id>sip:+1-212-555-1212:1234@gateway.com;user=phone</id><br><serviceid>4711</serviceid><br></requestor> |
| <b>Note:</b>          | References to the definition and the format of each of these types ,except ASPID, can be found in [23.271],                          |

### 5.3.80 resp\_req

|   |                              |
|---|------------------------------|
| <b>Description:</b>                                   |                              |
| This attribute represents the response time required. |                              |
| <b>Type:</b>  | Element                      |
| <b>Format:</b>  | Void                         |
| <b>Defined values:</b>                                |                              |
| <b>Default value:</b>                                 |                              |
| <b>Example:</b>                                       | <resp_req type="NO_DELAY" /> |
| <b>Note:</b>  |                              |

#### 5.3.80.1 type

|  |   |          |   |           |  |           |   |
|--|---|----------|---|-----------|--|-----------|---|
| <b>Description:</b>                                  |   |          |   |           |  |           |   |
| This attribute represents the response time required |   |          |   |           |  |           |   |
| <b>Type:</b>   | Attribute   |          |   |           |  |           |   |
| <b>Format:</b>                                       | Char String   |          |   |           |  |           |   |
| <b>Defined values:</b>                               | <table> <tr> <td>NO_DELAY</td> <td>No delay: The server SHOULD immediately return any location estimate that it currently has.</td> </tr> <tr> <td>LOW_DELAY</td> <td>Low delay: Fulfilment of the response time requirement takes precedence over fulfilment of the accuracy requirement.</td> </tr> <tr> <td>DELAY_TOL</td> <td>Delay tolerant: Fulfilment of the accuracy requirement takes precedence over fulfilment of the response time requirement.</td> </tr> </table> | NO_DELAY | No delay: The server SHOULD immediately return any location estimate that it currently has. | LOW_DELAY | Low delay: Fulfilment of the response time requirement takes precedence over fulfilment of the accuracy requirement. | DELAY_TOL | Delay tolerant: Fulfilment of the accuracy requirement takes precedence over fulfilment of the response time requirement. |
| NO_DELAY   | No delay: The server SHOULD immediately return any location estimate that it currently has.   |          |   |           |  |           |   |
| LOW_DELAY  | Low delay: Fulfilment of the response time requirement takes precedence over fulfilment of the accuracy requirement.  |          |   |           |  |           |   |
| DELAY_TOL  | Delay tolerant: Fulfilment of the accuracy requirement takes precedence over fulfilment of the response time requirement.   |          |   |           |  |           |   |
| <b>Default value:</b>                                | DELAY_TOL   |          |   |           |  |           |   |
| <b>Example:</b>                                      | <resp_req />  |          |   |           |  |           |   |
| <b>Note:</b>   | The interpretation of these parameters is defined in 3GPP [22.071] and [29.002]. When this parameter is used with the resp_timer, the resp_timer will take precedence over this parameter.  |          |   |           |  |           |   |

### 5.3.81 resp\_timer

|  |   |
|--|---|
| <b>Description:</b>  |   |
| Defines a timer for the response time within which the current location SHOULD be obtained and returned to the LCS Client. |   |
| <b>Type:</b>   | Element   |
| <b>Format:</b>   | Char String   |
| <b>Defined values:</b>   | Maximum number of seconds (must be $\geq 0$ )   |
| <b>Default value:</b>  | The default value is defined in the location server and will be implementation specific               |
| <b>Example:</b>  | <resp_timer>45</resp_timer>   |
| <b>Note:</b>   | When this parameter is used with the resp_req, this parameter will take precedence over the resp_req. |

## 5.3.82 result

|   |                                |
|---|--------------------------------|
| <b>Description:</b>   |                                |
| A text string indicating the result of the request or an individual positioning |                                |
| <b>Type:</b>  | Element                        |
| <b>Format:</b>  | Char string                    |
| <b>Defined values:</b>  | See section 5.4 "Result codes" |
| <b>Default value:</b>   |                                |
| <b>Example:</b>   | <result resid="0">OK</result>  |
| <b>Note:</b>  |                                |

### 5.3.82.1 resid

|  |                               |
|--|-------------------------------|
| <b>Description:</b>  |                               |
| This attribute represents a numeric representation of a result message |                               |
| <b>Type:</b>   | Attribute                     |
| <b>Format:</b>   | Char String                   |
| <b>Defined values:</b>   | [0-9]+                        |
| <b>Default value:</b>  |                               |
| <b>Example:</b>  | <result resid="0">OK</result> |
| <b>Note:</b>   | See section 5.4.              |

## 5.3.83 semiMajor

|  |                            |
|--|----------------------------|
| <b>Description:</b>  |                            |
| Specifies the length (in distanceUnit) of the semi-major axis of an ellipse. |                            |
| <b>Type:</b>   | Element                    |
| <b>Format:</b>   | Char String                |
| <b>Defined values:</b>   | [0-9]+                     |
| <b>Default value:</b>  |                            |
| <b>Example:</b>  | <semiMajor>560</semiMajor> |
| <b>Note:</b>   |                            |

## 5.3.84 semiMinor

|  |                            |
|--|----------------------------|
| <b>Description:</b>  |                            |
| Specifies the length (in distanceUnit) of the semi-minor axis of an ellipse. |                            |
| <b>Type:</b>   | Element                    |
| <b>Format:</b>   | Char String                |
| <b>Defined values:</b>   | [0-9]+                     |
| <b>Default value:</b>  |                            |
| <b>Example:</b>  | <semiMinor>560</semiMinor> |
| <b>Note:</b>   |                            |

## 5.3.85 Service attributes

### 5.3.85.1 res\_type

|   |                                    |  |
|---|------------------------------------|--|
| <b>Description:</b>   |                                    |  |
| Defines a response type at the Standard Location and Emergency and Historic Location Immediate Service. This attribute applies to the Standard Immediate Location Request message and the Emergency Immediate Location Request message and Historic Location Immediate Request. |                                    |  |
| <b>Type:</b>  | Attribute                          |  |
| <b>Format:</b>  | Char string                        |  |
| <b>Defined values:</b>  | SYNC                               | A LCS Client requests to receive the location response in one response   |
|   | ASYNC                              | A LCS Client allows to receive the location responses in pieces using several consecutive connections initiated by the location Server |
| <b>Default value:</b>   | SYNC                               |  |
| <b>Example:</b>   | <slir ver="3.4.0" res_type="SYNC"> |  |
| <b>Note:</b>  |                                    |  |

### 5.3.85.2 ver

|  |                            |  |
|--|----------------------------|--|
| <b>Description:</b>  |                            |  |
| Defines the version of the location protocol. This attribute is valid for ALL messages |                            |  |
| <b>Type:</b>   | Element                    |  |
| <b>Format:</b>   | Char string                |  |
| <b>Defined values:</b>   | [1-9]+[0-9]*.[0-9]+.[0-9]+ |  |
| <b>Default value:</b>  |                            |  |
| <b>Example:</b>  | <slia ver="3.4.0">         |  |
| <b>Note:</b>   |                            |  |

### 5.3.85.3 cause

|   |                                   |                          |
|---|-----------------------------------|--------------------------|
| <b>Description:</b>   |                                   |                          |
| Defines the reason for sending a Triggered Location Reporting Pause Report message. |                                   |                          |
| <b>Type:</b>  | Attribute                         |                          |
| <b>Format:</b>  | Char string                       |                          |
| <b>Defined values:</b>  | PAUSE                             | The reporting is paused  |
|   | RESUME                            | The reporting is resumed |
| <b>Default value:</b>   | N/A                               |                          |
| <b>Example:</b>   | <tlrpr ver="3.4.0" cause="PAUSE"> |                          |
| <b>Note:</b>  |                                   |                          |

### 5.3.85.4 last

|   |             |                          |
|---|-------------|--------------------------|
| <b>Description:</b>   |             |                          |
| Defines if the message is the last Triggered Location Query Report message. |             |                          |
| <b>Type:</b>  | Attribute   |                          |
| <b>Format:</b>  | Char string |                          |
| <b>Defined values:</b>  | YES         | This is the final TLQREP |
|   | NO          | More TLREP will follow   |

|                       |                                 |
|-----------------------|---------------------------------|
| <b>Default value:</b> | N/A                             |
| <b>Example:</b>       | <tlqrep ver="3.4.0" last="YES"> |
| <b>Note:</b>          |                                 |

### 5.3.85.5 more

|                        |   |  |
|------------------------|---|--|
| <b>Description:</b>    | Defines if a location report is segmented into several Triggered Location Report messages. If more Triggered Location Report messages will follow within a location report it is set to YES. In the last Triggered Location Report messages within a location report it is set to NO. |  |
| <b>Type:</b>           | Attribute   |  |
| <b>Format:</b>         | Char string   |  |
| <b>Defined values:</b> | YES   | More TLREP will follow within a location report          |
|                        | NO  | This is the final or only TLREP within a location report |
| <b>Default value:</b>  | NO  |  |
| <b>Example:</b>        | <tlrep ver="3.4.0" more="YES">  |  |
| <b>Note:</b>           |   |  |

### 5.3.86 serviceid

|                        |   |  |
|------------------------|---|--|
| <b>Description:</b>    | Specifies an id that is used by an entity to identify the service or application that is accessing the network. |  |
| <b>Type:</b>           | Element   |  |
| <b>Format:</b>         | Char String   |  |
| <b>Defined values:</b> | -   |  |
| <b>Default value:</b>  | -   |  |
| <b>Example:</b>        | <serviceid>0005</serviceid>   |  |
| <b>Note:</b>           |   |  |

### 5.3.86.1 type

|                        |  |  |
|------------------------|--|--|
| <b>Description:</b>    | Defines the type of the service that has been requested by the ASP   |  |
| <b>Type:</b>           | Attribute  |  |
| <b>Format:</b>         | Char string  |  |
| <b>Defined values:</b> | PASSIVE  | The service is one that is not directly initiated by the user. |
|                        | ACTIVE   | The service is one that the user is initiating personally.     |
| <b>Default value:</b>  | PASSIVE  |  |
| <b>Example:</b>        | <requestmode type="ACTIVE" />  |  |
| <b>Note:</b>           | The default value is set to PASSIVE, as this is likely to be the one that is most restrictively defined by the user. |  |

## 5.3.87 session

|   |  |
|---|--|
| <b>Description:</b>   |  |
| This element SHOULD be presented in the location request when the LCS Client has an active session with the User Equipment, this will be either the number called by the UE or the APN on which the UE established the session. |  |
| <b>Type:</b>  | Element  |
| <b>Format:</b>  | Char String  |
| <b>Defined values:</b>  | -  |
| <b>Default value:</b>   | -  |
| <b>Example:</b>   | <session type="DIAL">447073100177</session>  |
| <b>Note:</b>  | According to [23.271], for a call related location request, the LCS Client includes the LCS Client's called party number, as dialled by the target mobile user, in the LCS service request. For a session related location request, the LCS Client includes the APN-NI of the LCS Client, as used by the target UE, in the LCS service request. It means that it is up to the LCS Client whether the LCS service request is call/session related or not. |

### 5.3.87.1 type

|   |  |     |                    |      |   |
|---|--|-----|--------------------|------|---|
| <b>Description:</b>   |  |     |                    |      |   |
| Defines the type of session that is established between the User Equipment and LCS Client |  |     |                    |      |   |
| <b>Type:</b>  | Attribute  |     |                    |      |   |
| <b>Format:</b>  | Char string  |     |                    |      |   |
| <b>Defined values:</b>  | <table> <tr> <td>APN</td><td>Access Point Name.</td></tr> <tr> <td>DIAL</td><td>The number dialed by the user to access the LCS client.</td></tr> </table> | APN | Access Point Name. | DIAL | The number dialed by the user to access the LCS client. |
| APN   | Access Point Name.   |     |                    |      |   |
| DIAL  | The number dialed by the user to access the LCS client.  |     |                    |      |   |
| <b>Default value:</b>   |  |     |                    |      |   |
| <b>Example:</b>   | <session type="DIAL">447073100177</session>  |     |                    |      |   |
| <b>Note:</b>  |  |     |                    |      |   |

## 5.3.88 sessionid

|  |                                       |
|--|---------------------------------------|
| <b>Description:</b>  |                                       |
| Specifies an id that can be used by an entity to support privacy mechanisms, a sessionid may replace the need to use an ID and PWD to use the location services. In a request when a client and sessionid are present together the session id may indicate the number dialed by the end user to access the service or the APN through which the original session was established that initiated the service. The response indicates the sessionid that the entity can use on subsequent requests. In this case the sessionid could be a generated alphanumeric string and can be time-limited. |                                       |
| <b>Type:</b>   | Element                               |
| <b>Format:</b>   | Char String                           |
| <b>Defined values:</b>   |                                       |
| <b>Default value:</b>  |                                       |
| <b>Example:</b>  | <sessionid>34eg6.876.76h4</sessionid> |
| <b>Note:</b>   |                                       |

## 5.3.89 speed

|                             |         |
|-----------------------------|---------|
| <b>Description:</b>         |         |
| The speed of the MS in m/s. |         |
| <b>Type:</b>                | Element |

|                        |  |
|------------------------|--|
| <b>Format:</b>         | Char String  |
| <b>Defined values:</b> | [0-9]+   |
| <b>Default value:</b>  |  |
| <b>Example:</b>        | <speed>23</speed>  |
| <b>Note:</b>           | This element is present if speed is possible to attain by the used positioning method. |

### 5.3.90 start\_time

|                        |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
|------------------------|---|--------|-------------|------|------|----|-------|----|-----|----|-------|----|---------|----|---------|
| <b>Description:</b>    |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
|                        | This element defines the absolute start time in a time range.   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Type:</b>           | Element   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Format:</b>         | <p>Char String</p> <p>The time is expressed as yyyyMMddhhmmss where:</p> <table border="1"> <tr> <td>String</td> <td>Description</td> </tr> <tr> <td>yyyy</td> <td>Year</td> </tr> <tr> <td>MM</td> <td>Month</td> </tr> <tr> <td>dd</td> <td>Day</td> </tr> <tr> <td>hh</td> <td>Hours</td> </tr> <tr> <td>mm</td> <td>Minutes</td> </tr> <tr> <td>ss</td> <td>Seconds</td> </tr> </table> | String | Description | yyyy | Year | MM | Month | dd | Day | hh | Hours | mm | Minutes | ss | Seconds |
| String                 | Description   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| yyyy                   | Year  |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| MM                     | Month   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| dd                     | Day   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| hh                     | Hours   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| mm                     | Minutes   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| ss                     | Seconds   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Defined values:</b> |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Default value:</b>  |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Example:</b>        | <start_time>20010630142810</start_time>   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Note:</b>           |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |

#### 5.3.90.1 utc\_off

|                        |  |
|------------------------|--|
| <b>Description:</b>    |  |
|                        | Specifies the UTC [UTC] offset in hours and minutes. Positive values indicate time zones east of Greenwich.  |
| <b>Type:</b>           | Attribute  |
| <b>Format:</b>         | Char string  |
| <b>Defined values:</b> | [+ -]?0000-1400  |
| <b>Default value:</b>  |  |
| <b>Example:</b>        | <start_time utc_off="+0200">20020813010423</start_time>  |
| <b>Note:</b>           | utc_off is specified as 'HHMM', where 'HH' can range between 0-14 and 'MM' between '0-59'. All other values shall result in error 105, 'Format error'. |

### 5.3.91 startAngle

|                        |   |
|------------------------|---|
| <b>Description:</b>    |   |
|                        | The start angle is the angle (in angularUnit) between North and the first defined radius. |
| <b>Type:</b>           | Element   |
| <b>Format:</b>         | Char string   |
| <b>Defined values:</b> | 0-359°  |
| <b>Default value:</b>  |   |

|                 |                             |
|-----------------|-----------------------------|
| <b>Example:</b> | <startAngle>60</startAngle> |
| <b>Note:</b>    |                             |

### 5.3.92 stop\_time

|  |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
|--|---|--------|-------------|------|------|----|-------|----|-----|----|-------|----|---------|----|---------|
| <b>Description:</b>  |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| This element defines the absolute stop time in a time range. |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Type:</b>   | Element   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Format:</b>   | <p>Char String</p> <p>The time is expressed as yyyyMMddhhmmss where:</p> <table border="1"> <tr> <td>String</td> <td>Description</td> </tr> <tr> <td>yyyy</td> <td>Year</td> </tr> <tr> <td>MM</td> <td>Month</td> </tr> <tr> <td>dd</td> <td>Day</td> </tr> <tr> <td>hh</td> <td>Hours</td> </tr> <tr> <td>mm</td> <td>Minutes</td> </tr> <tr> <td>ss</td> <td>Seconds</td> </tr> </table> | String | Description | yyyy | Year | MM | Month | dd | Day | hh | Hours | mm | Minutes | ss | Seconds |
| String   | Description   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| yyyy   | Year  |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| MM   | Month   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| dd   | Day   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| hh   | Hours   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| mm   | Minutes   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| ss   | Seconds   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Defined values:</b>                                       |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Default value:</b>  |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Example:</b>  | <stop_time>20020630142810</stop_time>   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Note:</b>   |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |

#### 5.3.92.1 utc\_off

See section 5.3.90.1

### 5.3.93 stopAngle

|   |                            |
|---|----------------------------|
| <b>Description:</b>   |                            |
| The stop angle is the angle (in angularUnit) between the first and second defined radius. |                            |
| <b>Type:</b>  | Element                    |
| <b>Format:</b>  | Char string                |
| <b>Defined values:</b>  | 1-360°                     |
| <b>Default value:</b>   |                            |
| <b>Example:</b>   | <stopAngle>180</stopAngle> |
| <b>Note:</b>  |                            |

### 5.3.94 strict

|   |             |
|---|-------------|
| <b>Description:</b>                                     |             |
| Defines if civivloc is requested in location responses. |             |
| <b>Type:</b>  | Attribute   |
| <b>Format:</b>  | Char string |

|                        |                                  |  |
|------------------------|----------------------------------|--|
| <b>Defined values:</b> | YES                              | the returned position must only contain what was requested |
|                        | NO                               | the returned position may differ from what was requested   |
| <b>Default value:</b>  | NO                               |  |
| <b>Example:</b>        | <geoinfo strict="YES"></geoinfo> |  |
| <b>Note:</b>           |                                  |  |

### 5.3.95 subclient

|   |  |  |
|---|--|--|
| <b>Description:</b>   |  |  |
| Identifies the ASPs, resellers and portals in the chain of service providers between the network and the end-user |  |  |
| <b>Type:</b>  | Element  |  |
| <b>Format:</b>  |  |  |
| <b>Defined values:</b>  |  |  |
| <b>Default value:</b>   |  |  |
| <b>Example:</b>   | <subclient last_client="NO"><br><id>TheASP</id><br><serviceid>0006</serviceid><br></subclient> |  |
| <b>Note:</b>  |  |  |

#### 5.3.95.1 last\_client

|  |                               |  |
|--|-------------------------------|--|
| <b>Description:</b>  |                               |  |
| Identifies whether the SUBCLIENT is the last one in the chain or not |                               |  |
| <b>Type:</b>   | Attribute                     |  |
| <b>Format:</b>   | Char String                   |  |
| <b>Defined values:</b>   | YES                           | This is the last client – the one that the end-user is actually communicating with |
|  | NO                            | This is not the last client  |
| <b>Default value:</b>  | NO                            |  |
| <b>Example:</b>  | <subclient last_client="YES"> |  |
| <b>Note:</b>   |                               |  |

### 5.3.96 ta

|  |  |  |
|--|--|--|
| <b>Description:</b>  |  |  |
| This Radio Access Network element that can be used to offer enhanced positioning. (Timing Advance) |  |  |
| <b>Type:</b>   | Element  |  |
| <b>Format:</b>   | Char string  |  |
| <b>Defined values:</b>   | 0-63   |  |
| <b>Default value:</b>  | 0  |  |
| <b>Example:</b>  | <ta>3</ta>   |  |
| <b>Note:</b>   | Further Information regarding this element can be found in the relevant GSM Specifications [05.10] |  |

### 5.3.97 target\_area

|  |  |
|--|--|
| <b>Description:</b>  |  |
| Specify the target area in change_area event. This area may be composed of civic location elements which in turn may be combined with shape elements. If a civic location alone is specified, the Location Server will deduce to the best of its knowledge the area to cover (e.g. by prior provisioning or with a default value). |  |
| If both a shape and a civic location are specified, both requirements should be met.   |  |
| <b>Type:</b> Element   |  |
| <b>Format:</b>   |  |
| <b>Defined values:</b>   |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>  |  |
| <target_area><br><name_area>Seoul</name_area><br></target_area>  |  |
| <b>Note:</b>   |  |

### 5.3.98 target\_distance

|  |  |
|--|--|
| <b>Description:</b>  |  |
| Specifies the target distance expressed in meters in distance_event trigger. |  |
| <b>Type:</b> Element   |  |
| <b>Format:</b> Char string   |  |
| <b>Defined values:</b>   |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>  |  |
| <target_distance>30000</target_distance>                                     |  |
| <b>Note:</b>   |  |

### 5.3.99 target\_equidistance

|  |  |
|--|--|
| <b>Description:</b>  |  |
| Specifies the target equidistance expressed in meters in equidistance event trigger. |  |
| <b>Type:</b> Element   |  |
| <b>Format:</b> Char string   |  |
| <b>Defined values:</b>   |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>  |  |
| <target_equidistance>30000</target_equidistance>                                     |  |
| <b>Note:</b>   |  |

### 5.3.100 target\_speed

|  |  |
|--|--|
| <b>Description:</b>  |  |
| Specifies the target speed expressed in m/s in velocity_event trigger. |  |
| <b>Type:</b> Element   |  |
| <b>Format:</b> Char string   |  |
| <b>Defined values:</b>   |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>  |  |
| <target_speed>   |  |

|       |                                      |
|-------|--------------------------------------|
|       | <speed>30</speed><br></target_speed> |
| Note: |                                      |

### 5.3.101 time

| <b>Description:</b>  |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
|--|---|--------|-------------|------|------|----|-------|----|-----|----|-------|----|---------|----|---------|
| In a location answer this element indicates the time when the positioning was performed. |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Type:</b>   | Element   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Format:</b>   | <p>Char String</p> <p>The time is expressed as yyyyMMddhhmmss where:</p> <table border="1"> <thead> <tr> <th>String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>yyyy</td> <td>Year</td> </tr> <tr> <td>MM</td> <td>Month</td> </tr> <tr> <td>dd</td> <td>Day</td> </tr> <tr> <td>hh</td> <td>Hours</td> </tr> <tr> <td>mm</td> <td>Minutes</td> </tr> <tr> <td>ss</td> <td>Seconds</td> </tr> </tbody> </table> | String | Description | yyyy | Year | MM | Month | dd | Day | hh | Hours | mm | Minutes | ss | Seconds |
| String   | Description   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| yyyy   | Year  |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| MM   | Month   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| dd   | Day   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| hh   | Hours   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| mm   | Minutes   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| ss   | Seconds   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Defined values:</b>   |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Default value:</b>  |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Example:</b>  | <time>20010630142810</time>   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |
| <b>Note:</b>   |   |        |             |      |      |    |       |    |     |    |       |    |         |    |         |

### 5.3.102 time\_remaining

| <b>Description:</b>  |  |        |             |    |     |    |       |    |         |    |         |
|--|--|--------|-------------|----|-----|----|-------|----|---------|----|---------|
| Defines the time remaining until the location server terminates the current triggered location service. The time when the service is valid is either specified by the client using start time and stop time, or is a network operator specific default value where no stop time is defined or where the stop time exceeds the allowed value by the location server involved. |  |        |             |    |     |    |       |    |         |    |         |
| <b>Type:</b>   | Element  |        |             |    |     |    |       |    |         |    |         |
| <b>Format:</b>   | <p>Char String</p> <p>The time is expressed as ddhhmmss where:</p> <table border="1"> <thead> <tr> <th>String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>dd</td> <td>Day</td> </tr> <tr> <td>hh</td> <td>Hours</td> </tr> <tr> <td>mm</td> <td>Minutes</td> </tr> <tr> <td>ss</td> <td>Seconds</td> </tr> </tbody> </table> | String | Description | dd | Day | hh | Hours | mm | Minutes | ss | Seconds |
| String   | Description  |        |             |    |     |    |       |    |         |    |         |
| dd   | Day  |        |             |    |     |    |       |    |         |    |         |
| hh   | Hours  |        |             |    |     |    |       |    |         |    |         |
| mm   | Minutes  |        |             |    |     |    |       |    |         |    |         |
| ss   | Seconds  |        |             |    |     |    |       |    |         |    |         |
| <b>Defined values:</b>   |  |        |             |    |     |    |       |    |         |    |         |
| <b>Default value:</b>  | The default value is defined in the location server  |        |             |    |     |    |       |    |         |    |         |
| <b>Example:</b>  | <time_remaining>00010000</time_remaining>  |        |             |    |     |    |       |    |         |    |         |

|       |  |
|-------|--|
| Note: |  |
|-------|--|

### 5.3.103 trans\_id

|   |   |
|---|---|
| <b>Description:</b>   |   |
| An identifier originally provided by the client so it can associate responses to the original request |   |
| <b>Type:</b>  | Element   |
| <b>Format:</b>  | Char string   |
| <b>Defined values:</b>  | None  |
| <b>Default value:</b>   | None  |
| <b>Example:</b>   | <trans_id>uk999call04112417544312</trans_id>  |
| <b>Note:</b>  | trans_id is used to distinguish between multiple location requests of the same target.<br>This implementation is not supported when a range of MSID's are requested by the client |

### 5.3.104 trigger\_data

|  |  |
|--|--|
| <b>Description:</b>  |  |
| Specifies the req_id and one or more msid for an active trigger in triggered location query report |  |
| <b>Type:</b>   | Element  |
| <b>Format:</b>   |  |
| <b>Defined values:</b>   |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>  | <pre> &lt;trigger_data&gt;     &lt;req_id&gt;25283&lt;/req_id&gt;     &lt;msid&gt;461011678298&lt;/msid&gt;     &lt;msid&gt;461011678299&lt;/msid&gt; &lt;/trigger_data&gt; </pre> |
| <b>Note:</b>   |  |

#### 5.3.104.1 req\_id

See section 5.3.68.

#### 5.3.104.2 msid

See section 5.3.51.

### 5.3.105 trl\_pos

|  |   |
|--|---|
| <b>Description:</b>  |   |
| Specifies the position of the MS at a triggered location report. |   |
| <b>Type:</b>   | Element   |
| <b>Format:</b>   |   |
| <b>Defined values:</b>   |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>  | <tlr_pos trl_trigger="PERIODIC"><br><msid>4711</msid> |

|       |  |
|-------|--|
|       | <pre> &lt;poserr&gt;     &lt;result resid="1"&gt;SYSTEM FAILURE&lt;/result&gt;     &lt;time utc_off="0100"&gt;20011127104532&lt;/time&gt; &lt;/poserr&gt; &lt;/trl_pos&gt;</pre> |
| Note: |  |

### 5.3.105.1 trl\_trigger

|  |                                  |  |
|--|----------------------------------|--|
| <b>Description:</b>  |                                  |  |
| Specifies the trigger that initiated the positioning of the MS at a triggered location report. |                                  |  |
| <b>Type:</b>   | Attribute                        |  |
| <b>Format:</b>   | Char string                      |  |
| <b>Defined values:</b>   | PERIODIC                         | The positioning is triggered when the periodical timer expired           |
|  | MS_AVAIL                         | The positioning is triggered by the MS presence notification             |
|  | CHANGE_AREA                      | The positioning is triggered by the mobility event of the location of MS |
|  | VELOCITY                         | The positioning is triggered by the velocity event                       |
|  | DISTANCE                         | The positioning is triggered by the distance event                       |
|  | EQUIDISTANCE                     | The positioning is triggered by the equidistance event                   |
| <b>Default value:</b>  |                                  |  |
| <b>Example:</b>  | <tlr_pos trl_trigger="PERIODIC"> |  |
| <b>Note:</b>   |                                  |  |

### 5.3.105.2 pos\_method

See section 5.3.28.1

## 5.3.106 url

|   |   |
|---|---|
| <b>Description:</b>   |   |
| Specifies the location to which a response to a TLRR, an asynchronous SLIR or an asynchronous eme_lir should be sent to |   |
| <b>Type:</b>  | Element   |
| <b>Format:</b>  | Char string   |
| <b>Defined values:</b>  |   |
| <b>Default value:</b>   |   |
| <b>Example:</b>   | <url>http://location.client.com/Response/</url>   |
| <b>Note:</b>  | URL is part of pushaddr element which may also contain id and pwd. These elements are used by the LCS Client to inform the Location Server what credentials to use when ‘pushing’ a location report to the LCS Client in the case of an asynchronous service. |

### 5.3.107 velocity\_event

|  |         |
|--|---------|
| <b>Description:</b>  |         |
| Specifies a velocity event in triggered location reporting service |         |
| <b>Type:</b>   | Element |
| <b>Format:</b>   |         |
| <b>Defined values:</b>   |         |

|                       |  |
|-----------------------|--|
| <b>Default value:</b> |  |
| <b>Example:</b>       | <velocity_event type="ABOVE"><br><target_speed><br><speed>30</speed><br></target_speed><br></velocity_event> |
| <b>Note:</b>          |  |

### 5.3.107.1 type

|                        |   |   |
|------------------------|---|---|
| <b>Description:</b>    | Specifies the trigger criteria that will initiate reporting of the MS |   |
| <b>Type:</b>           | Attribute   |   |
| <b>Format:</b>         | Char string   |   |
| <b>Defined values:</b> | INCREASING ABOVE  | Reporting performed each time the MS speed increases above the target speed provided the minimum time between reports has elapsed. When the trigger is initiated it is assumed that the MS speed is below the target speed. |
|                        | ABOVE   | Reporting performed when MS speed is above the target speed provided the minimum time between reports has elapsed .   |
|                        | DECREASING BELOW  | Reporting performed each time the MS speed decreases below the target speed provided the minimum time between reports has elapsed. When the trigger is initiated it is assumed that the MS speed is above the target speed  |
|                        | BELOW   | Reporting performed when MS speed is below the target speed provided the minimum time between reports has elapsed .   |
| <b>Default value:</b>  |   |   |
| <b>Example:</b>        | <velocity_event type="ABOVE">   |   |
| <b>Note:</b>           |   |   |

### 5.3.107.2 vel\_estimates

|                        |  |  |
|------------------------|--|--|
| <b>Description:</b>    | Specifies whether velocity estimates are required or not.  |  |
| <b>Type:</b>           | Attribute  |  |
| <b>Format:</b>         | Char string  |  |
| <b>Defined values:</b> | TRUE   |  |
|                        | FALSE  |  |
| <b>Default value:</b>  |  |  |
| <b>Example:</b>        | <change_area vel_estimates="TRUE">   |  |
| <b>Note:</b>           | Velocity is reported as part of location estimate. Setting this attribute to TRUE implies that location also will be reported. |  |

### 5.3.108 vlrno

|  |  |
|--|--|
| <b>Description:</b>                        |  |
| Uniquely specifies a VLR within a network. |  |

|                        |   |
|------------------------|---|
| <b>Type:</b>           | Element   |
| <b>Format:</b>         | Char String   |
| <b>Defined values:</b> | In GSM this is the Global Title address. The Global Title is in the same format as an E.164 number. |
| <b>Default value:</b>  |   |
| <b>Example:</b>        | <vlrno>1541154871</vlrno>   |
| <b>Note:</b>           |   |

### 5.3.109 vmscno

|  |   |
|--|---|
| <b>Description:</b>                        |   |
| Uniquely specifies a VMS within a network. |   |
| <b>Type:</b>                               | Element   |
| <b>Format:</b>                             | Char String   |
| <b>Defined values:</b>                     | In GSM this is the Global Title address. The Global Title is in the same format as an E.164 number. |
| <b>Default value:</b>                      |   |
| <b>Example:</b>                            | <vmscno>1541154871</vmscno>   |
| <b>Note:</b>                               |   |

### 5.3.110 Width

|   |  |
|---|--|
| <b>Description:</b>                                     |  |
| This element specifies the requested width of map image |  |
| <b>Type:</b>  | Element  |
| <b>Format:</b>  | Char String  |
| <b>Defined values:</b>                                  | [0-9]+   |
| <b>Default value:</b>                                   | 0  |
| <b>Example:</b>   | <Width>800</Width>                                 |
| <b>Note:</b>  | The default type of map width is defined as pixel. |

### 5.3.111 X

|   |  |
|---|--|
| <b>Description:</b>                       |  |
| The first ordinate in a coordinate system |  |
| <b>Type:</b>                              | Element  |
| <b>Format:</b>                            | Char string  |
| <b>Defined values:</b>                    |  |
| <b>Default value:</b>                     |  |
| <b>Example:</b>                           | <x>63500</x>   |
| <b>Note:</b>                              | For the default WGS84 CRS the presentation format is Degrees Minutes Seconds Hemisphere (DMSH), with fields separated by a space character and with leading zeros added to any minute or second values less than 10. Note that in the WGS84 CRS 'x' denotes the <b>latitude</b> of a position.<br><br>For the default UTM CRS the presentation format is presented in meters. Note that in the UTM |

|  |   |
|--|---|
|  | CRS 'X' denotes the <b>easting</b> of a position. |
|--|---|

### 5.3.112 Y

|                        |   |
|------------------------|---|
| <b>Description:</b>    | Second ordinate in a coordinate system. This is optional if it is a linear coordinate system.   |
| <b>Type:</b>           | Element   |
| <b>Format:</b>         | Char string   |
| <b>Defined values:</b> |   |
| <b>Default value:</b>  |   |
| <b>Example:</b>        | <Y>4832438</Y>  |
| <b>Note:</b>           | <p>For the default WGS84 CRS the presentation format is Degrees Minutes Seconds Hemisphere (DMSH), with fields separated by a space character and with leading zeros added to any minute or second values less than 10. Note that in the WGS84 CRS 'Y' denotes the <b>longitude</b> of a position.</p> <p>For the default UTM CRS the presentation format is presented in meters. Note that in the UTM CRS CRS 'Y' denotes the <b>northing</b> of a position.</p> |

### 5.3.113 Z

|                        |  |
|------------------------|--|
| <b>Description:</b>    | third ordinate in a coordinate system which has at least three ordinates   |
| <b>Type:</b>           | Element  |
| <b>Format:</b>         | Char string  |
| <b>Defined values:</b> |  |
| <b>Default value:</b>  |  |
| <b>Example:</b>        | <Z>498</Z>   |
| <b>Note:</b>           | The default Coordinate Reference System WGS84 (#4326 of the EPSG database) uses an "Ellipsoidal 2D Coordinate System". This means for a potential altitude value the parameter 'alt' (cf. 5.3.2 of MLP) is used. |

### 5.3.114 Zone

|                        |  |
|------------------------|--|
| <b>Description:</b>    | first and the mandatory component in the representation of a location in UTM coordinate system |
| <b>Type:</b>           | Element  |
| <b>Format:</b>         | Char string  |
| <b>Defined values:</b> | 1 to 60  |
| <b>Default value:</b>  |  |
| <b>Example:</b>        | <Zone>20</Zone>  |
| <b>Note:</b>           | Stands for Zone information of a position in UTM Coordinate System.                            |

### 5.3.115 Zoom

|                        |  |
|------------------------|--|
| <b>Description:</b>    | This element specifies the requested zoom level of zoom of map image |
| <b>Type:</b>           | Element  |
| <b>Format:</b>         | Char String  |
| <b>Defined values:</b> | [0-9]+   |
| <b>Default value:</b>  | 0  |
| <b>Example:</b>        | <Zoom>10.5</Zoom>  |
| <b>Note:</b>           | The default type of Zoom is KILOMETER.                               |

#### 5.3.115.1 ZoomType

|                        |  |
|------------------------|--|
| <b>Description:</b>    | This element specifies the The zoomtype of Map Requestzoom level |
| <b>Type:</b>           | Attribute  |
| <b>Format:</b>         | Char String  |
| <b>Defined values:</b> | KILOMETER  |
|                        | METER  |
|                        | MILE   |
|                        | INCH   |
| <b>Default value:</b>  | KILOMETER  |

|                 |                                     |
|-----------------|-------------------------------------|
| <b>Example:</b> | <Zoom ZoomType="KILOMETER">1</Zoom> |
| <b>Note:</b>    |                                     |

|              |   |
|--------------|---|
| <b>Note:</b> | A specific value of element_type may only occur once in a civic location (civicloc) |
|--------------|---|

## 5.4 Result codes

### 5.4.1 Result codes

This table defines the result codes that indicate the result of the request or individual positioning. The error codes are divided in ranges:

|     |   |     |                                 |
|-----|---|-----|---------------------------------|
| 0   | - | 99  | Location server specific errors |
| 100 | - | 199 | Request specific errors         |
| 200 | - | 299 | Network specific errors         |
| 300 | - | 499 | Reserved for future use         |
| 500 | - | 599 | Vendor specific errors          |
| 600 | - | 699 | MLS Client specific errors      |

**Note:** For privacy reasons it might be needed to not report certain specific errors. In this case it is up to the implementation or configuration of the location server which errors will be reported.

| Resid | Slogan                   | Description  |
|-------|--------------------------|--|
| 0     | OK                       | No error occurred while processing the request.  |
| 1     | SYSTEM FAILURE           | The request can not be handled because of a general problem in the location server.  |
| 2     | UNSPECIFIED ERROR        | An unspecified error used in case none of the other errors apply. This can also be used in case privacy issues prevent certain errors from being presented.  |
| 3     | UNAUTHORIZED APPLICATION | The requesting location-based application is not allowed to access the location server or a wrong password has been supplied.  |
| 4     | UNKNOWN SUBSCRIBER       | Unknown subscriber. The user is unknown, i.e. no such subscription exists.   |
| 5     | ABSENT SUBSCRIBER        | Absent subscriber. The user is currently not reachable.  |
| 6     | POSITION METHOD FAILURE  | Position method failure. The location service fails to obtain the user's position. The exact cause may be indicated in ADD_INFO by the inclusion of an event code (A, B, C etc.) from the list below:<br>A: Target does not support SUPL.<br>B: SUPL Positioning Failure—Target does not support requested service. For example a SUPL 1.0 device doesn't support periodic trigger service.<br>C: SUPL Positioning Failure—Target fails to deliver Cell Info.<br>D: SUPL Positioning Failure—both Cell ID location and |

|     |  |  |
|-----|--|--|
|     |  | GNSS positioning fail.   |
| 7   | TIMEOUT  | Timer expiry for the requested event trigger   |
| 101 | CONGESTION IN LOCATION SERVER                  | The request can not be handled due to congestion in the location server.   |
|     |  |  |
| 103 | UNSUPPORTED VERSION                            | The Location server does not support the indicated protocol version.   |
| 104 | TOO MANY POSITION ITEMS                        | Too many position items have been specified in the request.  |
| 105 | FORMAT ERROR                                   | A protocol element in the request has invalid format. The invalid element is indicated in ADD_INFO.  |
| 106 | SYNTAX ERROR                                   | The position request has invalid syntax. Details may be indicated in ADD_INFO.   |
| 107 | PROTOCOL ELEMENT NOT SUPPORTED                 | A protocol element specified in the position request is not supported by the Location Server, or the position result is not supported by the LCS Client. The element is indicated in ADD_INFO. |
| 108 | SERVICE NOT SUPPORTED                          | The requested service is not supported in the Location Server. The service is indicated in ADD_INFO.   |
| 109 | PROTOCOL ELEMENT ATTRIBUTE NOT SUPPORTED       | A protocol element attribute is not supported in the Location Server. The attribute is indicated in ADD_INFO.  |
| 110 | INVALID PROTOCOL ELEMENT VALUE                 | A protocol element in the request has an invalid value. The element is indicated in ADD_INFO.  |
| 111 | INVALID PROTOCOL ELEMENT ATTRIBUTE VALUE       | A protocol element attribute in the request has a wrong value. The element is indicated in ADD_INFO.   |
| 112 | PROTOCOL ELEMENT VALUE NOT SUPPORTED           | A specific value of a protocol element is not supported in the Location Server. The element and value are indicated in ADD_INFO.   |
| 113 | PROTOCOL ELEMENT ATTRIBUTE VALUE NOT SUPPORTED | A specific value of a protocol element attribute is not supported in the Location Server. The attribute and value are indicated in ADD_INFO.   |
| 114 | CANCELLATION OF TRIGGERED LOCATION REQUEST     | The requested triggered location report is cancelled.  |
| 115 | INVALID MSID IN TLRSR                          | One or more msid elements in the Triggered Location Reporting Stop Request are not valid to the Location Server.   |
| 116 | TLRSR FOR INDIVIDUAL TARGET NOT SUPPORTED      | The function of stopping triggered location reporting for individual target(s) is not supported in Location Server.  |
| 201 | QOP NOT ATTAINABLE                             | The requested QoP cannot be provided. The exact QoP parameter which cannot be provided, i.e. accuracy, response time or max_loc_age, and value are indicated in ADD_INFO.                      |
| 202 | POSITIONING NOT ALLOWED                        | The subscriber does not allow the application to position him/her for whatever reason (privacy settings in location server, LCS privacy class).  |
| 203 | CONGESTION IN MOBILE NETWORK                   | The request can not be handled due to congestion in the mobile network.  |
| 204 | DISALLOWED BY LOCAL REGULATIONS                | The location request is disallowed by local regulatory requirements.   |
| 207 | MISCONFIGURATION OF LOCATION SERVER            | The location server is not completely configured to be able to calculate a position.   |
| 208 | TARGET MOVED TO NEW MSC/SGSN                   | The triggered Location Request has been aborted due to that target has moved to another MSC/SGSN. This result code shall only be used towards The Home Location Server.                        |

|          |  |  |
|----------|--|--|
|          |  | Restrictions:<br>- This code SHALL only be used in RLP.<br>- This result code shall only be used towards The Home Location Server. |
| 500 -599 |  | Vendor specific errors   |
| 601      | STANDARD LOCATION REPORT SERVICE NOT SUPPORTED           | The MLS Client does not support the standard location report service.  |
| 602      | MLS CLIENT ERROR   | An error occurred in the MLS Client.   |
| 603      | STANDARD LOCATION REPORT SERVICE NOT ACCEPTED            | The standard location report was not accepted by the MLS Client.   |
| 604      | SUBSCRIBER IN STANDARD LOCATION REPORT SERVICE NOT VALID | The subscriber in the Standard Location Report is not valid to the MLS Client.   |
| 605      | INVALID SERVICE ID IN STANDARD LOCATION REPORT SERVICE   | The service identity in the Standard Location Report is not valid to the MLS Client.   |

## 5.5 Adaptation to 3GPP LCS (Informative)

### 5.5.1 Version mapping between 3GPP TS23.271 and this specification

The following table shows the version number of this specification (OMA-TS-MLP-V3\_4) fully conforming to a certain version of 3GPP TS23.271, i.e. the version of this specification for the correct reference in a certain version of the 3GPP specification.

| 3GPP TS23.271 version number | Conforming version number of OMA-LOC_MLP_Spec-V3_4 |
|------------------------------|--|
| Release 5                    | Version 3.1  |
| Release 6                    | Version 3.2  |
| Release 7                    | Version 3.3  |
| Release 10                   | Version 3.4  |

**Note:** In case there are versions not appearing in this table, it should be interpreted that such update did not affect the other specification. That is, the version number not appearing in the table should apply to the conformance mapping for the closest smaller version number in the table.

### 5.5.2 The terminology mapping table with 3GPP LCS Specifications

The following is a list of the terms in MLP used differently from the ones defined for 3GPP:

| Term                             |                                 | Notes                                |
|----------------------------------|---------------------------------|--------------------------------------|
| MLP                              | 3GPP                            |                                      |
| Location Server                  | LCS Server                      |                                      |
| MS (Mobile Station)              | UE                              |                                      |
| MSID (Mobile Station Identifier) | Identification of the target UE |                                      |
| MPC (Mobile Positioning Centre)  |                                 | There is no term applicable to 3GPP. |

### 5.5.3 The corresponding terms used for the location procedures in 3GPP LCS Definition

The following is a list of terms defined in MLP corresponding to the 3GPP LCS definition [23.271] for the location procedures.

| Location procedures defined in 3GPP[23.271]                                   |   | Services defined in MLP                   |
|---|---|---|
| Circuit Switched Mobile Terminating Location Request<br>CS-MT-LR              | LCS Service Request                                   | Standard Location Immediate Request       |
|   | LCS Service Response                                  | Standard Location Immediate Answer        |
| CS-MT-LR without HLR Query - applicable to North America Emergency Calls only | LCS Service Request                                   | Emergency Location Immediate Request      |
|   | LCS Service Response                                  | Emergency Location Immediate Answer       |
| Packet Switched Mobile Terminating Location Request<br>PS-MT-LR               | LCS Service Request                                   | Standard Location Immediate Request       |
|   | LCS Service Response                                  | Standard Location Immediate Answer        |
| Network Induced Location Request<br>NI-LR                                     | Location Information                                  | Emergency Location Report                 |
| Packet Switched Network Induced Location Request<br>PS-NI-LR                  | Location Information                                  | Emergency Location Report                 |
| Mobile Terminating Deferred Location Request                                  | LCS Service Request                                   | Triggered Location Reporting Request      |
|   | LCS Service Response(Provide Subscriber Location ack) | Triggered Location Reporting Answer       |
|   | LCS Service Response(Subscriber Location Report)      | Triggered Location Report                 |
| Combined Periodical/Deferred Mobile Terminating Location Request              | LCS Service Request                                   | Triggered Location Reporting Request      |
|   | LCS Service Response(Provide Subscriber Location ack) | Triggered Location Reporting Answer       |
|   | LCS Service Response(Subscriber Location Report)      | Triggered Location Report                 |
| Cancellation of a Deferred Location Request                                   | LCS Cancel Service Request                            | Triggered Location Reporting Stop Request |
|   | LCS Cancel Service Response                           | Triggered Location Reporting Stop Answer  |
| Mobile Originating Location Request, Circuit Switched CS-MO-LR                | Location Information                                  | Standard Location Report                  |
|   | Location Information Ack                              | Standard Location Report Answer           |
| Mobile Originating Location Request, Packet Switched PS-MO-LR                 | Location Information                                  | Standard Location Report                  |
|   | Location Information Ack                              | Standard Location Report Answer           |

## 5.5.4 Error Mapping (Informative)

The following list provides a mapping between the errors defined for LCS in MAP (see [29.002]) and MLP (see section 5.4)

| MAP error                                     | MLP resid |
|---|-----------|
| Unknown subscriber                            | 4         |
| Unidentified Subscriber                       | 4         |
| Absent Subscriber                             | 5         |
| System failure                                | 1         |
| Facility Not Supported                        | 6         |
| Unexpected Data Value                         | 1         |
| Data missing                                  | 1         |
| Unauthorised LCS Client with detailed reason  | 3         |
| Position method failure with detailed reason. | 6         |
| Illegal Subscriber                            | 2         |
| Illegal Equipment                             | 2         |
| Unauthorized requesting network               | 2         |

## 5.6 HTTP Mapping

This section describes how to use MLP over the HTTP transport mechanism using "HTTP/1.1".

HTTP is a request/response protocol involving a server and a client. In the context of MLP, the client is referred to as the LCS Client and the server is the Location Server (GMLC/MPC). For more information about HTTP, refer to [RFC2616] and <http://www.w3.org>.

The Location Server MAY provide two socket ports for operation, one for encryption with SSL/TLS and one without. The reason for having one insecure port is that encryption can consume resources, and if the client is in a secure domain there might not be a need for encryption. Applications residing in an insecure domain, i.e. on the Internet, may use the secure port to ensure the security and privacy of the location information.

For further information about SSL/TLS see [RFC2246].

Four port numbers have been selected and proposed as standard ports for location servers implementing MLP. These ports are registered with IANA (Internet Assigned Numbers Authority, see [IANA]). The four port numbers are:

|           |          |                          |
|-----------|----------|--------------------------|
| lif-mlp   | 9210/tcp | LIF Mobile Locn Protocol |
| lif-mlp   | 9210/udp | LIF Mobile Locn Protocol |
| lif-mlp-s | 9211/tcp | LIF Mobile Locn Secure   |
| lif-mlp-s | 9211/udp | LIF Mobile Locn Secure   |

A Location Server MAY choose to introduce any other socket based or HTTP transparent technology for secure transfers. Any such technology SHALL be provided over a different port than the four mentioned above.

## 5.6.1 Location Services using HTTP

An LCS Client SHALL request a Location Service by issuing an HTTP POST request towards the Location Server. For more information about HTTP POST, see [RFC2616]. The request line syntax is shown below.

Request-line = POST SP path SP HTTP/1.1 CRLF

The request MUST include the entity-header Content-length field as part of the request. The message body of the request SHALL include the XML formatted request and SHALL have the length specified by the LCS Client in the Content-length field.

If the request is a triggered request the result SHALL be delivered to the LCS client through an HTTP POST operation issued by the Location Server. This implies that the LCS client MUST be able to receive HTTP POST requests and give a valid response.

All Location Services are invoked by sending a request using HTTP POST to a certain URI. An example of an URI is shown below.

<http://location-server.example.com:9210/LocationQueryService/>

The response to the invocation of a Location Service SHALL be returned using an HTTP response.

If the LCS client requests standard location of asynchronous mode, triggered reporting of location, the Location Server SHALL return the report by performing an HTTP POST operation towards the client. The client must specify the URI that the answer should be posted to. This is done in the service request or by having it in the LCS client profile that can be stored in the Location Server.

The report SHALL be included in the message body and the Content-length entity SHALL be set to the length of the answer.

When an LCS client attempts to invoke a service request that is not defined in this specification, the Location Server SHALL return a General Error Message (GEM) in a HTTP '404' error response:

Status-Line= HTTP/1.1 SP 404 SP Not Found CRLF

### 5.6.2 Request and Response Encapsulation

A request SHALL have a header part and a body part. A response MAY have a header part and SHALL have a body part. To be able to make a location request with a single XML document the header and the body are encapsulated in the same service initiation DTD. The context header holds the authentication and authorization data pertinent to a particular location request. The body part is described in the sections 5.2.3.2- 5.2.3.6.

### 5.6.2.1 Service Initiation DTD

```

#### 5.6.2.3 Message Sequence Diagram

The following HTTP sequence (cf. Figure 9) is used for all the defined service requests/responses in MLP.

**Figure 9: HTTP sequence for MLP request/response pairs**

The following HTTP sequence diagram (cf. Figure 10) is used for all defined reports in MLP except for Standard Location Report.

**Figure 10: HTTP sequence for MLP reports**

The following HTTP sequence diagram (cf. Figure 11) is used for the report and answer in Standard Location Reporting Service.

**Figure 11:** HTTP sequence for MLP Standard Location Reporting Service.

The following HTTP sequence diagram (cf. Figure 12) is used in the case of a General Error Message.

**Figure 12:** HTTP sequence for the General Error Message

## 5.7 Geographic Information

### 5.7.1 Coordinate Reference systems (Informative)

The study of determining the relative positions on or close to the surface of the earth is a complex science, referred to as geodesy. A complete definition of Coordinate Reference systems is not within the scope of this standard. This section includes a brief overview of the subject. For more details see the OpenGIS® Consortium Abstract Specification Topic 2 [AST].

#### 5.7.1.1 The Geoid, ellipsoids and datums

The Geoid is a physically realizable surface defined by the set of points with equal gravity potential approximately at the Mean Sea Level. While this surface is measurable it is not easy to define mathematically. In order to use known mathematics, the Geoid is approximated by an ellipsoid (spheroid).

There are many ellipsoids, each defined to best approximate some part of the Geoid. These ellipsoids are defined by an ellipse that is rotated about the major axis. There are many methods for defining an ellipse, the most common used in Geodesy the length of the semi-major axis and the flattening. This defines a mathematical ellipsoid for calculations. It does not provide enough information to locate the ellipsoid with respect to the Geoid or other ellipsoids. To locate the ellipsoid in space a datum is defined. Some of the common ellipsoids are WGS84, Bessel1841, Clark 1866.

A datum is the ellipsoid with its position in space. The position is defined by the origin and orientation of the ellipsoid with respect to the Geoid. Different datums locate latitude, longitude at different positions in space. For example ellipsoids Samboja, CH1903 and Stockholm are each based on Bessel1841, the National Geodetic Network and World Geodetic System 1984 are based on WGS84.

## 5.7.1.2 Coordinate systems

A coordinate system is the link between the datum and the coordinate values. It defines all of the information about the axes system that defines the values. The names of the axes, their units (formats), the order of ordinates ((Easting, Northing) versus (Northing, Easting)) and the angle between the axes are defined by the coordinate system.

### 5.7.1.2.1 Cartesian coordinate systems

A Cartesian coordinate system is defined by values of (x,y,(z)). x is the distance from the x-axis, y is the distance from the y-axis, z the distance from the z-axis. The axis are orthogonal to each other. The unit used for x, y, z are a distance unit, such as meter. These coordinate systems are used for flat 'planar' descriptions of points. In general they are used over small areas where a projection method has been used to minimize distortions of the geography in the area.

### 5.7.1.2.2 Ellipsoid coordinates

More global geographic calculations need to take the surface of the earth into account. So we need a second coordinate system that describes each position relative to other points and lines on the earth's surface.

Each point can then be described as set of values (longitude, latitude) or (longitude, latitude, altitude) giving a point on the ellipsoid or relative to the ellipsoid we choose to describe the earth (cf. Figure 13). The longitude tells us how far east we have to move on the equator from the null-meridian, the latitude tells us how far north to move from the equator and the altitude tells us how far above the ellipsoid to go to finally reach the location. Negative values direct us to go in the opposite direction.

**Figure 13: Ellipsoid Coordinates**

## 5.7.1.3 Coordinate Reference Systems

The two coordinate reference systems relevant to this protocol are Geographic 2D Coordinate Reference Systems and Projected Coordinate Reference Systems.

Geographic 2D Coordinate Reference Systems describe locations on the ellipsoid. They are used for large national or continental geodetic networks. In particular GPS uses the Geographic 2D Coordinate Reference System WGS84. This uses the World Geodetic System 1984 based on the WGS84 ellipsoid. The coordinate axes have units of decimal degrees (or DMSH) with ordinate order (Northing, Easting). This Coordinate Reference System is the default for all basic MLP service requests and responses. A GMLC is only required to support WGS84. The GMLC geographies that are defined with altitude

are modeled in this protocol as geographies in a Geographic 2D CRS with a separate altitude element, not as a Geographic 3D CRS. The geographies are planar and carrying a constant z value is not desirable.

There are several ways to convert ellipsoid coordinates to 2 dimensional cartesian coordinates. These are called projection methods. Each method is designed to minimize some type of distortion in the mapping for the ellipsoid to the 2D Cartesian coordinate system.

Projected Coordinate Reference Systems are used for map display, to allow Cartesian mathematics and for Advanced Location Services.

## **5.7.2 Coordinate Reference System Transformations (Informative)**

A transformation is used to define a point in one CRS into the appropriate values in a second CRS. When the datums are the same, the transformation can frequently be defined by equations. A transformation from one datum to another is usually done with a least squares approximation. Transformation equations are available in from several places, transformation services are also available.

## **5.7.3 Methodology for defining CRSs and transformations in this protocol (Informative)**

The MLP protocol defines the CRS by citing an authority and the unique reference identifier for the CRS defined by this authority. This leaves the definition of many CRS used over the world to be defined by a group of geodesy experts. This methodology is used by the OpenGIS® Consortium and the ISO TC 211 working group for well-known CRS. The encoding used is from the OpenGIS® Consortium Recommendation Paper 01-014r5: Recommended Definition Data for Coordinate Reference Systems and Coordinate Transformations [CRS].

The MLP protocol may use the {EPSG} authority as an example. Support of other authority is for further study. This database is defined by a Microsoft Access database which can be found at [www.epsg.org](http://www.epsg.org). An xml version of this database will be available at <http://www.opengis.net/gml/srs/epsg.xml> in the future.

The default WGS84 CRS is defined to be 4326 by the EPSG authority. Other examples are 326xx define the UTM xx N zones.

EPSG recommends that real numbers are used for internal data processing but that for interfacing with human beings the preferred representation be degree, minute, second, hemisphere (DMSH). For geographic coordinate reference systems with coordinate systems in degrees.

Where the value is held in several fields, as for example in DMSH representation, various symbols, words or character strings are in use as field identifiers and separators. For DMSH representation EPSG recommends that the degree, minute and second units are indicated through the suffixed symbols ° ' " (ASCII character codes 186, 39 and 34) respectively, for example 35°45'09.18"N, 65°45'09.18"W. Spaces are excluded from the separator and for minute and second values under 10 leading zeroes are included.

## **5.7.4 Supported coordinate systems and datum (Normative)**

All MLP implementations MUST support at least the WGS84 Coordinate Reference System.

## **5.7.5 Shapes representing a geographical position (Informative)**

There are a number of shapes used to represent a geographic area that describes where a mobile subscriber is located. There are additional shapes that are required for advanced MLP services. The standards bodies for geographic data for advanced MLP services such as routing, geocoding, coordinate conversion, and map display are the Location Interoperability Forum, the OpenGIS® Consortium and the ISO TC211 working group. The current public XML specification defining geography from these groups is GML V211 [GML]. These two groups work together and are working towards a GML V3 with additional geometry and topology types. The geometry required for the MLP is the GMLV211 with additional polygon types with boundaries that contain circles, ellipses or circular arcs. GML V3 will define the linear curves segments to allow these polygons to be defined. These boundaries will be defined as special cases of polygons, using the given interpolation methods. The following geographies are defined in this protocol. The relevant OGC Abstract Specification is Topic 1 [GEO].

### 5.7.5.1 Ellipsoid point

This a point on the ellipsoid and is modeled as a point in a Geographic 2D Coordinate Reference Systems.

### 5.7.5.2 Ellipsoid point with uncertainty circle

An ellipsoid point with uncertainty circle is characterized by the coordinates of an ellipsoid point (the origin) and a radius, "r" (cf. Figure 14). It describes the set of points on the ellipsoid, which are at a distance from the point of origin less than or equal to "r". This shape can be used to indicate points on the Earth surface, or near the Earth surface. This shape is a special case of a polygon with no interior boundaries.

The typical use of this shape is to indicate a point when its position is known only with a limited accuracy.

**Figure 14: Ellipsoid point with uncertainty circle**

### 5.7.5.3 Ellipsoid point with uncertainty ellipse

The shape of an "ellipsoid point with uncertainty ellipse" is characterized by the following (cf. Figure 15):

- The coordinates of an ellipsoid point (the origin)
- The distances  $r_1$  and  $r_2$
- The angle of orientation  $A$

It describes formally the set of points on the ellipsoid, which fall within or on the boundary of an ellipse. This ellipse has a semi-major axis of length  $r_1$  oriented at angle  $A$  (0 to 180°) measured clockwise from north and a semi-minor axis of length  $r_2$ . The distances being the geodesic distance over the ellipsoid, i.e., the minimum length of a path staying on the ellipsoid and joining the two points, as shown in figure below.

As for the ellipsoid point, this can be used to indicate points on the Earth's surface, or near the Earth's surface, of same latitude and longitude. This shape is a special case of a polygon with no interior boundaries.

The typical use of this shape is to indicate a point when its position is known only with a limited accuracy, but the geometrical contributions to uncertainty can be quantified.

**Figure 15: Ellipsoid point with uncertainty ellipse**

#### 5.7.5.4 Ellipsoid point with uncertainty arc

The shape of an "ellipsoid point with uncertainty arc" is characterized by the following (cf. Figure 16):

- The coordinates of an ellipsoid point (the origin)
- The inner radius( $r_1$ ) and uncertainty radius( $r_2$ ),
- The offset angle ( $\theta$ ) and included angle ( $\beta$ )

An arc is defined by a point of origin with one offset angle and one uncertainty angle plus one inner radius and one uncertainty radius. In this case the striped area describes the actual arc area. The smaller arc defines the inner radius( $r_1$ ) and the difference between inner and the outer arc defines the uncertainty radius( $r_2$ ). This shape is a special case of a polygon with no interior boundaries.

**Figure 16: Ellipsoid point with uncertainty arc**

### 5.7.5.5 Polygon

A Polygon is a connected surface. Any pair of points in the polygon can be connected to one another by a path. The boundary of the Polygon is a set of LinearRings. We distinguish the outer (exterior) boundary and the inner (interior) boundaries; the LinearRings of the interior boundary cannot cross one another and cannot be contained within one another. There must be at most one exterior boundary and zero or more interior boundary elements. The ordering of LinearRings and whether they form clockwise or anti-clockwise paths is not important. The minimum number of points allowed in a LinearRing is 3.

A LinearRing is a closed, simple piece-wise linear path which is defined by a list of coordinates that are assumed to be connected by straight line segments. The last coordinate must be coincident with the first coordinate and at least four coordinates are required (the three to define a ring plus the fourth duplicated one) except for the case where this geometry is used in the construction of a Polygon the last coordinate may, to conform to [23.032], be different to the first coordinate, in which case the last coordinate will be connected to the first coordinate by a straight line segment.

For basic MLP services polygons are the number of interior boundaries MUST be 0. Also to conform to [23.032] the maximum number of points allowed in an exterior boundary is 15. The points shall be connected in the order that they are given.

The described area is situated to the right of the exterior boundaries and left of the interior boundaries with the downward direction being toward the Earth's center and the forward direction being from a point to the next.

**Note:** This definition does not permit connecting lines greater than roughly 20 000 km. If such a need arises, the polygon can be described by adding an intermediate point.

Computation of geodesic lines is not simple. Approximations leading to a maximum distance between the computed line and the geodesic line of less than 3 meters are acceptable.

### 5.7.5.6 LineString

A LineString is a piece-wise linear path defined by a list of coordinates that are assumed to be connected by straight line segments. A closed path is indicated by having coincident first and last coordinates. At least two coordinates are required.

### 5.7.5.7 Box

The Box element is used to encode extents. Each <Box> element encloses a sequence of two <coord> elements containing exactly two coordinate tuples; the first of these is constructed from the minimum values measured along all axes, and the second is constructed from the maximum values measured along all axes

### 5.7.5.8 Geometries Collections

These are geometry objects that contain 2 or more primitive geometry objects. These collections can either be homogenous, a set of points, or heterogeneous, a point, circularArea and a LineString.

Geometry collections are not valid for the basic MLP services.

## Appendix A. Change History

## B.2.24 Support for Result Elements

| Item        | Function | Reference | Status | Requirement |
|-------------|----------|-----------|--------|-------------|
| MLP-U-S-001 | add_info | 5.2.2.4   | O      |             |
| MLP-U-S-002 | result   | 5.2.2.4   | M      |             |

## B.2.25 Support for Shape Elements

| Item        | Function        | Reference | Status | Requirement  |
|-------------|-----------------|-----------|--------|--|
| MLP-V-S-001 | shape           | 5.2.2.5   | M      | MLP-V-S-002 OR MLP-V-S-003 OR MLP-V-S-004 OR MLP-V-S-005 OR MLP-V-S-006 OR MLP-V-S-007 OR MLP-V-S-008 OR MLP-V-S-009 OR MLP-V-S-010 OR MLP-V-S-011 |
| MLP-V-S-002 | Point           | 5.2.2.5   | O      |  |
| MLP-V-S-003 | LineString      | 5.2.2.5   | O      |  |
| MLP-V-S-004 | Box             | 5.2.2.5   | O      |  |
| MLP-V-S-005 | LinearRing      | 5.2.2.5   | O      |  |
| MLP-V-S-006 | Polygon         | 5.2.2.5   | O      |  |
| MLP-V-S-007 | CircularArcArea | 5.2.2.5   | O      |  |

| Item        | Function        | Reference | Status | Requirement |
|-------------|-----------------|-----------|--------|-------------|
| MLP-V-S-008 | EllipticalArea  | 5.2.2.5   | O      |             |
| MLP-V-S-009 | MultiLineString | 5.2.2.5   | O      |             |
| MLP-V-S-010 | MultiPoint      | 5.2.2.5   | O      |             |
| MLP-V-S-011 | MultiPolygon    | 5.2.2.5   | O      |             |

## B.2.26 Support for Quality of Position Elements

| Item        | Function    | Reference | Status | Requirement |
|-------------|-------------|-----------|--------|-------------|
| MLP-W-S-001 | eqop        | 5.2.2.6   | O      |             |
| MLP-W-S-002 | qop         | 5.2.2.6   | O      |             |
| MLP-W-S-003 | ll_acc      | 5.2.2.6   | O      |             |
| MLP-W-S-004 | hor_acc     | 5.2.2.6   | O      |             |
| MLP-W-S-005 | max_loc_age | 5.2.2.6   | O      |             |
| MLP-W-S-006 | resp_req    | 5.2.2.6   | O      |             |
| MLP-W-S-007 | resp_timer  | 5.2.2.6   | O      |             |
| MLP-W-S-008 | alt_acc     | 5.2.2.6   | O      |             |

## B.2.27 Support for Network Parameters Elements

| Item        | Function      | Reference | Status | Requirement                |
|-------------|---------------|-----------|--------|----------------------------|
| MLP-X-S-001 | gsm_net_param | 5.2.2.7   | O      |                            |
| MLP-X-S-002 | cgi           | 5.2.2.7   | O      |                            |
| MLP-X-S-003 | neid          | 5.2.2.7   | O      | MLP-X-S-004 OR MLP-X-S-005 |

| MLP-X-S-016 | lmsi          | 5.2.2.7   | O      |                            |
| MLP-X-S-017 | imsi          | 5.2.2.7   | O      |                            |

## B.2.28 Support for Context Elements

| Item        | Function  | Reference | Status | Requirement |
|-------------|-----------|-----------|--------|-------------|
| MLP-Y-S-001 | client    | 5.2.2.8   | M      |             |
| MLP-Y-S-002 | sessionid | 5.2.2.8   | O      |             |
| MLP-Y-S-003 | id        | 5.2.2.8   | O      |             |
| MLP-Y-S-004 | requestor | 5.2.2.8   | O      |             |

| Item        | Function      | Reference | Status | Requirement |
|-------------|---------------|-----------|--------|-------------|
| MLP-Y-C-009 | applicationid | 5.2.2.8   | O      |             |
| MLP-Y-S-005 | pwd           | 5.2.2.8   | O      |             |
| MLP-Y-S-006 | serviceid     | 5.2.2.8   | O      |             |
| MLP-Y-S-007 | requestmode   | 5.2.2.8   | O      |             |
| MLP-Y-S-008 | subclient     | 5.2.2.8   | O      |             |

## B.2.29 Service attributes

| Item        | Function | Reference | Status | Requirement |
|-------------|----------|-----------|--------|-------------|
| MLP-Z-S-001 | res_type | 5.3.75    | M      |             |
| MLP-Z-S-002 | ver      | 5.3.75    | M      |             |

## B.2.30 Transport mechanisms

| Item         | Function                            | Reference  | Status | Requirement |
|--------------|-------------------------------------|------------|--------|-------------|
| MLP-AA-S-001 | Support of HTTP mapping             | 5.2.1, 5.6 | M      |             |
| MLP-AA-S-002 | Support of port 9210                | 5.6        | O      |             |
| MLP-AA-S-003 | Support of port 9211                | 5.6        | O      |             |
| MLP-AA-S-004 | Support of transfer over other port | 5.6        | O      |             |

## B.2.31 Services

| Item         | Function                             | Reference | Status | Requirement   |
|--------------|--------------------------------------|-----------|--------|---|
| MLP-AB-S-001 | Standard Location Immediate Service  | 5.2.3.2   | M      | MLP-A-S-003 AND MLP-B-S-003   |
| MLP-AB-S-002 | Emergency Location Immediate Service | 5.2.3.3   | O      | MLP-A-S-004 AND MLP-B-S-004   |
| MLP-AB-S-003 | Standard Location Reporting Service  | 5.2.3.4   | O      | MLP-B-S-005 AND MLP-B-S-006   |
| MLP-AB-S-004 | Emergency Location Reporting Service | 5.2.3.5   | O      | MLP-B-S-009   |
| MLP-AB-S-005 | Triggered Location Reporting Service | 5.2.3.6   | O      | MLP-A-S-005 AND MLP-A-S-006 AND MLP-B-S-010 AND MLP-B-S-011 AND MLP-B-S-012 |
| MLP-AB-S-006 | Historic Location Immediate Service  | 5.2.3.6   | O      | MLP-A-S-008 AND MLP-B-S-014   |

## B.2.32 Triggered Location Reporting Pause Report

| Item         | Function            | Reference | Status | Requirement |
|--------------|---------------------|-----------|--------|-------------|
| MLP-AC-S-002 | msid                | 5.2.3.6.6 | M      |             |
| MLP-AC-S-001 | req_id              | 5.2.3.6.6 | M      |             |
| MLP-AC-S-003 | extension parameter | 5.2.3.6.6 | O      |             |
| MLP-AC-S-004 | lcs_ref             | 5.2.3.6.6 | O      |             |

### B.2.33 Triggered Location Reporting Query Request

| Item         | Function            | Reference | Status | Requirement |
|--------------|---------------------|-----------|--------|-------------|
| MLP-AD-S-001 | extension parameter | 5.2.3.6.7 | O      |             |

### B.2.34 Triggered Location Reporting Query Answer

| Item         | Function            | Reference | Status | Requirement |
|--------------|---------------------|-----------|--------|-------------|
| MLP-AE-S-001 | query_id            | 5.2.3.6.8 | M      |             |
| MLP-AE-S-002 | result              | 5.2.3.6.8 | M      |             |
| MLP-AE-S-003 | add_info            | 5.2.3.6.8 | O      |             |
| MLP-AE-S-004 | extension parameter | 5.2.3.6.8 | O      |             |

### B.2.35 Triggered Location Query Report

| Item         | Function            | Reference | Status | Requirement |
|--------------|---------------------|-----------|--------|-------------|
| MLP-AF-S-001 | query_id            | 5.2.3.6.9 | M      |             |
| MLP-AF-S-002 | trigger_data        | 5.2.3.6.9 | O      |             |
| MLP-AF-S-003 | extension parameter | 5.2.3.6.9 | O      |             |
